Shams and delusions are esteemed for soundest truths, while reality is fabulous, if men would steadily observe realties only, and not allow themselves to be deluded, life, to compare it with such things as we know, would be like a fairy tale and the Arabian Nights' entertainments. If we respect only what is inevitable and has right to be, music and poetry would resound along the streets. When we are unhurried and wise, we perceive that only great and worthy things have any permanent and absolute existence that petty fears and petty pleasures are but the shadow of the reality. This is always exhilarating and sublime. By closing the eyes and slumbering, and consenting to be deceived by shows, men establish and confirm their daily life of routine and habit everywhere, which still is built on purely illusory foundations. Children, who play life, discern its true law and relations more clearly than men, who fail to live it worthily but who think that they are wiser by experience; that is, by failure.

I have read in a Hindu book that there was a king's son who, being expelled in infancy from his native city, was brought up by a forester, and, growing up to maturity it that state, imagined himself to belong to the barbarous race with which he lived. One of his father's ministers having discovered him, revealed to him what he was, and the misconception of his character was removed and he knew himself to. be a prince, "So soul," continues the Hindu philosopher, "from the circumstances in which it is placed, mistakes its own character, until the truth is revealed to it by some holy teacher and then it knows itself to be Brahma."

If a man should give us an account of the realities he beheld, we should not recognise the place in his description. Look at a meeting-house, or a courthouse, or a jail, or a shop, or a dwelling house, and say what that thing really is before a true gaze, and they would all go to pieces in your account of them. Men esteem truth remote, in the outskirts of the system, behind the farthest star, before Adam and after the last man. In eternity there is indeed something true and sublime but all these times and places and occasions are now and here. God Himself culminates in the present moment, and will never be more divine in the lapse of all ages. And we are enabled to apprehend at all what is sublime and noble only by the perpetual instilling and drenching of the reality that surrounds us. The universe constantly and obediently answers to our conceptions; whether we travel fast or slow, the track is laid for us. Let us spend our lives in conceiving, then. The poet or the artist never yet had so fair and noble a design but some of his posterity at least could accomplish it.

The writer's attitude toward the arts is one of

A. Indifference B. Suspicion C. Admiration D. Repulsion

The author is primarily concerned with urging the reader to

A. Mediate on the meaninglessness of the present.
B. Appraise the present for its true value.
C. Look to the future for enlightenment.
D. Spend more time in the leisure activities.

cat1996 english-language passage-reading

## 5.2.55 English Language: CAT 1996 | Question: 95 top

NOBODY disputes that wage inequality is on the rise in most rich countries, and especially in America. Exactly how much inequality has gone up remains a matter of dispute, but the trend is clear. And it is not just a matter of incomes soaring at the

very top and/or plunging (relatively speaking) at the very bottom: the distribution of incomes is being stretched throughout its span. Why?

A plausible one-word answer, von might think, is “computers”. Information technology replaces the unskilled; less demand means lower wages: At the same time computers complement the skills of more sophisticated types — the “knowledge workers” who represent, according to pundits such as Robert Reich, the future of work. This complementarily raises individuals’ productivity and thereby increases their earning power. The prosperous get more so, the unskilled get dumped.

Superficially appealing, the knowledge-worker part of this story has always seemed, on reflection, half-baked. Its advocates concentrate on the wagedispersing role of PCs. But the trend of rising inequality dates back much further than the 1980s, when the PC caught on. Also, research (as well as casual observation) shows that office PCs are chiefly used for word processing and cranking out spreadsheets. It is hard to believe that top managers’ wages are rising relative to the mean because bosses are doing their own typing. And the typical spreadsheet cruncher is not a corporate top-dog but a middle-level clerk or accountant whose wage is failing to keep pace with his boss’s.

Statistics do show that wages are correlated with use of PCs. But the question is whether PCs have raised workers’ wages or were merely put on the desks of workers who were well-paid to begin with. Among evidence for the latter view is one study that showed pay to be as strongly correlated with the use of pencils as with the use of PCs. As yet, nobody has argued that pencils have shifted the income distribution.

A new study by Timothy Bresnahan of Stanford University reflects on these and other findings and offers a quite different view. Yes, the paper argues, IT has had, and will continue to have, profound effects on jobs and wages—but not through the largely bogus knowledge-worker channel.

Rather than emphasising PCs as a way to improve the productivity of individual workers, Mr Bresnahan sees computing as an agent of revolution in whole organisations. Beginning not with PCs but much earlier, computers have indeed been used as substitutes for low-skill clerical workers. The pattern began in the 1950s, when hugely expensive mainframe computers were first used to save correspondingly huge sums in information-intensive functions in the financialservices industry, then in accounting, payroll and inventory- control tasks in other big organisations.

It is unsurprising that this kind of innovation, which spread in scale and scope as the cost of computing came down, should have lowered the wages of the unskilled. But how did it raise the wages of people higher up the income range? Mr Bresnahan’s answer is that it raised the demand for two kinds of worker—neither of them knowledge workers in the Reichian sense.

First, as back-office jobs (susceptible to automation) have declined in importance, front-office jobs (which require certain bundles of skills, especially social skills) have increased. In other words, there is less mindless paper-shuffling and more dealing with customers, suppliers and other humans. Second,- such far-reaching organisational innovation puts exceptional demands on managers—not as power-users of Windows, heaven forbid, but as leaders of men. The phase of mere automation is difficult to manage in its own right; beyond that lies the even more important phase of identifying and pursuing the new business opportunities that the technology has brought within reach. Front-office workers with “people skills” and good managers (in the old-fashioned sense of that term) are the main winners from the IT revolution.

This story might seem more persuasive as an account of the early stages of the IT revolution than of what is happening now. Mr. Bresnahan argues, on the contrary, that this pattern of innovation is going to persist. PCs, as such, he regards as an unimportant technology so far as the labour market is concerned. However, networks of PCs are another thing: the advance of networked-computer systems in business has already led, he argues, to a new surge of organisational innovation. Inter-organisational networking, involving the automation of company bureaucracies devoted to buying and selling, could in future be as fruitful as the earlier phases of large-scale business automation: as he points out, “the amount of mid-skill white-collar work in buying and selling is stunning.”

The only drawback of this emphasis on the organisational as opposed to individual-worker complementarily of IT is that it makes it harder to say exactly which skills the economy is going to need. Indeed, if Mr. Bresnahan is right, economists’ standard ways of categorising workers according to skill are wrong: there is more (or less) to it than education and training, narrowly defined. Thanks to computers, oddly enough, the ability to get on well with other people is going to be even more valuable in future than it has been up to now. Possible slogan for far-sighted governments: courtesy, our strategic economic resource.

Why is the knowledge-worker theory considered to be half-baked in explaining rising wage inequalities?

A. Its advocates concentrate on the wage dispersing role of PCs.
B. Office PCs are chiefly used for word processing and spreadsheets.
C. inequality dates back much further than the 1980s.
D. it is a combination of many factors.

cat1996 english-language passage-reading

## 5.2.56 English Language: CAT 1996 | Question: 96 top

NOBODY disputes that wage inequality is on the rise in most rich countries, and especially in America. Exactly how much inequality has gone up remains a matter of dispute, but the trend is clear. And it is not just a matter of incomes soaring at the very top and/or plunging (relatively speaking) at the very bottom: the distribution of incomes is being stretched throughout its

span. Why?

A plausible one-word answer, von might think, is “computers”. Information technology replaces the unskilled; less demand means lower wages: At the same time computers complement the skills of more sophisticated types — the “knowledge workers” who represent, according to pundits such as Robert Reich, the future of work. This complementarily raises individuals’ productivity and thereby increases their earning power. The prosperous get more so, the unskilled get dumped.

Superficially appealing, the knowledge-worker part of this story has always seemed, on reflection, half-baked. Its advocates concentrate on the wagedispersing role of PCs. This story might seem more persuasive as an account of the early stages of the IT revolution than of what is happening now. Mr. Bresnahan argues, on the contrary, that this pattern of innovation is going to persist. PCs, as such, he regards as an unimportant technology so far as the labour market is concerned. However, networks of PCs are another thing: the advance of networked-computer systems in business has already led, he argues, to a new surge of organisational innovation. Inter-organisational networking, involving the automation of company bureaucracies devoted to buying and selling, could in future be as fruitful as the earlier phases of large-scale business automation: as he points out, “the amount of mid-skill white-collar work in buying and selling is stunning.”

The only drawback of this emphasis on the organisational as opposed to individual-worker complementarily of IT is that it makes it harder to say exactly which skills the economy is going to need. Indeed, if Mr. Bresnahan is right, economists’ standard ways of categorising workers according to skill are wrong: there is more (or less) to it than education and training, narrowly defined. Thanks to computers, oddly enough, the ability to get on well with other people is going to be even more valuable in future than it has been up to now. Possible slogan for far-sighted governments: courtesy, our strategic economic resource.

Because of the IT revolution, we can expect the wages of the following to rise:

1. software experts

2. people who can use computers effectively

3. managers

A. 1 & 2 B. 2 & 3 C. Only 1 D. Only 3

cat1996 english-language passage-reading

## 5.2.59 English Language: CAT 1996 | Question: 99 top

NOBODY disputes that wage inequality is on the rise in most rich countries, and especially in America. Exactly how much inequality has gone up remains a matter of dispute, but the trend is clear. And it is not just a matter of incomes soaring at the very top and/or plunging (relatively speaking) at the very bottom: the distribution of incomes is being stretched throughout its span. Why?

A plausible one-word answer, von might think, is “computers”. Information technology replaces the unskilled; less demand

means lower wages: At the same time computers complement the skills of more sophisticated types — the "knowledge workers" who represent, according to pundits such as Robert Reich, the future of work. This complementarily raises individuals' productivity and thereby increases their earning power. The prosperous get more so, the unskilled get dumped.

Superficially appealing, the knowledge-worker part of this story has always seemed, on reflection, half-baked. Its advocates concentrate on the wagedispersing role of PCs. But the trend of rising inequality dates back much further than the 1980s, when the PC caught on. Also, research (as well as casual observation) shows that office PCs are chiefly used for word processing and cranking out spreadsheets. It is hard to believe that top managers' wages are rising relative to the mean because bosses are doing their own typing. And the typical spreadsheet cruncher is not a corporate top-dog but a middle-level clerk or accountant whose wage is failing to keep pace with his boss's.

Statistics do show that wages are correlated with use of PCs. But the question is whether PCs have raised workers' wages or were merely put on the desks of workers who were well-paid to begin with. Among evidence for the latter view is one study that showed pay to be as strongly correlated with the use of pencils as with the use of PCs. As yet, nobody has argued that pencils have shifted the income distribution.

A new study by Timothy Bresnahan of Stanford University reflects on these and other findings and offers a quite different view. Yes, the paper argues, IT has had, and will continue to have, profound effects on jobs and wages—but not through the largely bogus knowledge-worker channel.

Rather than emphasising PCs as a way to improve the productivity of individual workers, Mr Bresnahan sees computing as an agent of revolution in whole organisations. Beginning not with PCs but much earlier, computers have indeed been used as substitutes for low-skill clerical workers. The pattern began in the 1950s, when hugely expensive mainframe computers were first used to save correspondingly huge sums in information-intensive functions in the financialservices industry, then in accounting, payroll and inventory- control tasks in other big organisations.

It is unsurprising that this kind of innovation, which spread in scale and scope as the cost of computing came down, should have lowered the wages of the unskilled. But how did it raise the wages of people higher up the income range? Mr Bresnahan's answer is that it raised the demand for two kinds of worker—neither of them knowledge workers in the Reichian sense.

First, as back-office jobs (susceptible to automation) have declined in importance, front-office jobs (which require certain bundles of skills, especially social skills) have increased. In other words, there is less mindless paper-shuffling and more dealing with customers, suppliers and other humans. Second,- such far-reaching organisational innovation puts exceptional demands on managers—not as power-users of Windows, heaven forbid, but as leaders of men. The phase of mere automation is difficult to manage in its own right; beyond that lies the even more important phase of identifying and pursuing the new business opportunities that the technology has brought within reach. Front-office workers with "people skills" and good managers (in the old-fashioned sense of that term) are the main winners from the IT revolution.

This story might seem more persuasive as an account of the early stages of the IT revolution than of what is happening now. Mr. Bresnahan argues, on the contrary, that this pattern of innovation is going to persist. PCs, as such, he regards as an unimportant technology so far as the labour market is concerned. However, networks of PCs are another thing: the advance of networked-computer systems in business has already led, he argues, to a new surge of organisational innovation. Inter-organisational networking, involving the automation of company bureaucracies devoted to buying and selling, could in future be as fruitful as the earlier phases of large-scale business automation: as he points out, "the amount of mid-skill white-collar work in buying and selling is stunning."

The only drawback of this emphasis on the organisational as opposed to individual-worker complementarily of IT is that it makes it harder to say exactly which skills the economy is going to need. Indeed, if Mr. Bresnahan is right, economists' standard ways of categorising workers according to skill are wrong: there is more (or less) to it than education and training, narrowly defined. Thanks to computers, oddly enough, the ability to get on well with other people is going to be even more valuable in future than it has been up to now. Possible slogan for far-sighted governments: courtesy, our strategic economic resource.

Which of the following effects will networking bring in organisations?

A. it will bring in a new surge of organisational innovation
B. it will lead to automation of mid-skill white collar work
C. it will lead to less bureaucracy
D. none of the above

## 5.2.60 English Language: CAT 1997 | Question: 1 top

Select the pair that best expresses a relationship similar to the one expressed in the question pair

BARGE: VESSEL

A. Cargo: Hold
B. Link: Chain
C. Shovel: Implement
D. Squadron: Plane

cat1997 english-language

Answer key

## 5.2.61 English Language: CAT 1997 | Question: 100 top

Read the passages given below carefully and answer the questions that follow.

Water plays a versatile role in the functioning of the biosphere. The water cycle has two distinct branches – the atmospheric branch and the terrestrial branch. In the atmosphere, water exists mainly in gaseous form. On the earth, liquid forms and solid forms (ice/snow) predominate.

Water is important to the biosphere in that it is from water that the biosphere draws its most, abundant element, hydrogen. Hydrogen in the form of carbohydrates constitutes a very important source of energy for all living things. Although we have a plentiful supply of water in the oceans, it is not of direct use to use. We have to depend upon a small stock of water - less than 1% - contained in our rivers and freshwater lakes and in the subsoil. Even this small proportion can cause havoc to life if it is not properly managed: the reference here is to floods.

While relief measures are undoubtedly important, attention has to be focused on long-term flood control measures. In the past, we had constructed flood moderation reservoirs across catchment's areas of rivers and built 19, 260 km of embankments and 27, 850 km length of drainage channels. Besides 18, 900 villages have been raised above the flood level up to March 1997.

The fact is that long-term flood control measures, to be effective, should include both traditional methods and a forestation measures. The intensity of floods may be reduced by keeping the drainage channels clear and removing the accumulated silt from reservoirs and riverbeds. In fact, the dams built have trapped silt coming from the hills and prevented its large accumulation in riverbeds downstream. Hence the new emphasis on building more dams in the northern rivers should be welcomed. The embankments also need to be reinforced. In many places, they are just made of mud and sand and easily breached by a little gush of water. Other improvements should be in the regulation of water discharge from filled reservoirs and in the flood forecasting system. Even the present warning system, though inadequate, has helped to save many valuable lives and property. Since the states have been lethargic in implementing flood control schemes and since most rivers flow through many states, it would be better if flood control is handled by the Centre. The mighty Himalayan rivers are unlikely to be tamed unless we have a basic understanding as to how floods originate. Since 1947, Indian and foreign scientists have been repeatedly emphasising that the volume of water in the Himalayan rivers in the monsoons is the combined effect of rainfall, snowmelt and glacier discharges. Even the first expert committed to set up by Nehru had opined that a serious study of the snow melt and glacier discharges are essential for avoiding flood disasters in the north. But efforts in this direction during the last 50 years have been very inadequate. Now that satellite pictures are available detailing the snow cover in the Himalayas over large areas it would do well to initiate measures to obtain the relevant data from such pictures. Field studies in the Himalayan region would also help flood control measures.

According to the passage, flood problem arises because:

A. Afforestation and soil conservation measures have not been taken
B. Reservoirs across catchment areas of rivers have not been built
C. Embankments have not been built
D. Drainage channels have not been laid

Arrange sentences a, b, c and d in a proper sequence so as to make a coherent paragraph.

a. I sat there frowning at the [illegible]

A. adbc B. bcda C. bdca D. abcd

cat1997 english-language

### 5.2.95 English Language: CAT 1997 | Question: 5 top

Select the pair that best expresses a relationship similar to the one expressed in the question pair.

LOVE: AFFECTION

A. Happiness : joy
B. Amity: harmony
C. Enemy: hatred
D. Sorrow: misery

cat1997 english-language

### 5.2.96 English Language: CAT 1997 | Question: 51 top

**Read the passages given below carefully and answer the questions that follow:**

Many surprises lie in store for an academic who strays into the real world. The first such surprise to come my way during a stint as a university administrator related to the photocopying machines within my jurisdiction. I discovered that paper for the machines plus contractual maintenance cost substantially more than photocopies in the private market. This took no account of the other costs of the photocopiers -ink, spare parts, the space occupied by the machine, the interests and depreciation on it, the wages of the machine operator, the loss of time when the machine broke down or the operator absented himself.

The university–and indeed the entire educational system - was in a financial crisis. Here was a situation calling for a quick and painless execution of all white elephants, or so I thought. I proposed that we stop using the photocopying machines and get our photocopies made by a private operator who had rented space from our institution. Further, we could reduce our costs well below the market price through an agreement with the private operator, which would let him run our surplus machines in exchange for a price concession.

I had expected my proposal to be eagerly embraced by an impoverished university. Instead, it created a furore. In a progressive institution like ours, how could I have the temerity to suggest handing over a university asset to the private sector? Perhaps 1 was in the pay of the private operator. Friends and well-wishers emphasised the necessity of immediately distancing myself from any plan that may conceivably benefit a private entrepreneur - even if it should concurrently benefit the university. That, I gathered, was the essence of financial rectitude.

Abashed, I repented my indiscretion. The photocopying machines were of course no longer used, but neither were they transferred to the enemy in the private sector. We got our photocopying done privately at market prices, not the confessional rates I had proposed. The university lost money, but the family silver was saved from the private enemy. After a decently long period gathering dust and cobwebs, it could be sold as scrap, but that would not be during my tenure.

The story of the photocopying machines is repeated in many different guises throughout our public and semipublic institutions. The public sector is replete with unproductive assets, their sterile purity jealously protected from the seductive influences of private enterprise. There are the pathetic load factors in our power plants. There are fleets of public buses lying in idle disrepair in our state transport depots. There is the fertilizer plant, which has never produced even a gram of fertilizer because, after its executive had scoured the wide world in search of the cheapest possible parts, they found that the specifications of these parts did not match each other. There are the 80 gas guzzling staff cars boasted of by a north Indian university which has little else to boast about.

Perhaps the most spectacular instances of unproductive government assets relate to land. Five years ago, the then minister for surface transport, Jadish Tytler, suggested a plan for developing the vast tracts of unused land in the Delhi Transport Corporation's bus depots. He argued, entirely credibly, that by leasing out this land for commercial purposes, the DTC could not only cover its chronic and massive deficit but achieve a substantial surplus. The proposal was never implemented; the infiltration of the private sector into DTC depots was heroically resisted by various government department departments and the corporation continued its relentless plunge deeper into the red.

All other examples of public extravagance, however, pale into insignificance alongside the astronomical wastefulness perpetrated by the New Delhi municipal committee and the design of Edwin Lutyen's Delhi. Delhi unlike all other major cities of the world has a hollow centre – the density of population at the heart of town is negligible. In design, it is no modem metropolis but a medieval imperial capital like the Baghdad of the Abbasid Caliphate. The very centre of the city is entirely

occupied by the almost empty palaces of the mighty while hoi polloi throng the periphery and travel long distances daily to serve their masters.

Within the charmed circle of inner New Delhi, ministers and members of parliament, the top military brass and the bureaucratic and the judicial elite of the country luxuriate in sprawling bungalows nestling amidst lush greenery in almost sylvan surroundings. The total land area occupied by these bungalows is one of the best-kept official secrets. The ministry of urban development keeps no count of aggregates, but it appears that there are about 600 bungalows with areas varying from one to 10 acres. A not implausible estimate of the total area is about 10 million square yards.

A conservative estimate of the value of land in central New Delhi is Rs.1, 00, 000 per square yard. Six hundred families of VIPs are occupying real estate worth about Rs.1, 000 billion; at an interest rate bf 12%. This sum would yield an annual income of Rs.120 billion. This amounts to more than one per cent of the gross domestic product.

If the government were to move these six hundred families to the outskirts of the town and lease this land out, say for multi-storied residential construction – subject, of course, to environmental restrictions that would protect the existing greenery – the primary deficit of India would be wiped out.

What is more, rents would drop all over the city and the housing problem of Delhi would be solved, if not fully, at least in substantial measure. Further, there would be a major inward shift of population reducing transport requirements, and making it more lucrative for public transport to ply through inner Delhi. The removal of the six hundred would, at one stroke, relieve the accommodation and transport problems of Delhi as well as the budget deficit of the country. But who would bell the cat? Would the government do it, considering that 600 are the government?

Public interest litigation has of late highlighted a relatively minor aspect of the VIP housing issue: the abuse of ministerial discretion in making out of turn allotments. This focuses attention on the question of a fair distribution between the members of the elite of the fruits of power. In the process, unfortunately, a question of infinitely larger import has been conveniently consigned to oblivion. Doesn't the entire scheme of VIP housing in New Delhi imply organized plunder of the citizenry on a scale quite unprecedented and totally incompatible with the principles of a democratic society?

Strangely enough, this matter has entirely eluded the searchlight of public attention. Political parties, the media public interest litigants, grass root people's movements have all maintained a resounding reticence on the issue. When the excesses perpetrated in the name of VIP security provoked public protest, the Prime Minister desired that VIP security should be made "unobtrusive". VIP housing, however, is an entirely unobtrusive burden on the public, but a burden of quite mind-boggling proportions. Perhaps it is the silent character of this infliction that has made it so easy to impose. Or perhaps centuries of colonial rule have made habitual slaves of us: a mere 50 years of democracy cannot erase our slavish habit of obsequiousness to the imperial state and its rulers.

The author's experience taught him that the essence of financial rectitude involved:

A. Dissociating from any plan which benefits a private entrepreneur even if it concurrently benefits a public institution.
B. Supporting any plan which benefits a public institution while benefiting a private entrepreneur.
C. Dissociating from any plan which benefits a private entrepreneur at the cost of a public institution.
D. Supporting any plan which benefits a public institution at the cost of a private entrepreneur

## 5.2.97 English Language: CAT 1997 | Question: 52 top

**Read the passages given below carefully and answer the questions that follow:**

Many surprises lie in store for an academic who strays into the real world. The first such surprise to come my way during a stint as a university administrator related to the photocopying machines within my jurisdiction. I discovered that paper for the machines plus contractual maintenance cost substantially more than photocopies in the private market. This took no account of the other costs of the photocopiers -ink, spare parts, the space occupied by the machine, the interests and depreciation on it, the wages of the machine operator, the loss of time when the machine broke down or the operator absented himself.

The university–and indeed the entire educational system - was in a financial crisis. Here was a situation calling for a quick and painless execution of all white elephants, or so I thought. I proposed that we stop using the photocopying machines and get our photocopies made by a private operator who had rented space from our institution. Further, we could reduce our costs well below the market price through an agreement with the private operator, which would let him run our surplus machines in exchange for a price concession.

I had expected my proposal to be eagerly embraced by an impoverished university. Instead, it created a furore. In a progressive institution like ours, how could I have the temerity to suggest handing over a university asset to the private sector? Perhaps 1 was in the pay of the private operator. Friends and well-wishers emphasised the necessity of immediately distancing myself from any plan that may conceivably benefit a private entrepreneur - even if it should concurrently benefit the university. That, I gathered, was the essence of financial rectitude.

Abashed, I repented my indiscretion. The photocopying machines were of course no longer used, but neither were they transferred to the enemy in the private sector. We got our photocopying done privately at market prices, not the confessional rates I had proposed. The university lost money, but the family silver was saved from the private enemy. After a decently long

period gathering dust and cobwebs, it could be sold as scrap, but that would not be during my tenure.

The story of the photocopying machines is repeated in many different guises throughout our public and semipublic institutions. The public sector is replete with unproductive assets, their sterile purity jealously protected from the seductive influences of private enterprise. There are the pathetic load factors in our power plants. There are fleets of public buses lying in idle disrepair in our state transport depots. There is the fertilizer plant, which has never produced even a gram of fertilizer because, after its executive had scoured the wide world in search of the cheapest possible parts, they found that the specifications of these parts did not match each other. There are the 80 gas guzzling staff cars boasted of by a north Indian university which has little else to boast about.

Perhaps the most spectacular instances of unproductive government assets relate to land. Five years ago, the then minister for surface transport, Jadish Tytler, suggested a plan for developing the vast tracts of unused land in the Delhi Transport Corporation's bus depots. He argued, entirely credibly, that by leasing out this land for commercial purposes, the DTC could not only cover its chronic and massive deficit but achieve a substantial surplus. The proposal was never implemented; the infiltration of the private sector into DTC depots was heroically resisted by various government department departments and the corporation continued its relentless plunge deeper into the red.

All other examples of public extravagance, however, pale into insignificance alongside the astronomical wastefulness perpetrated by the New Delhi municipal committee and the design of Edwin Lutyen's Delhi. Delhi unlike all other major cities of the world has a hollow centre – the density of population at the heart of town is negligible. In design, it is no modem metropolis but a medieval imperial capital like the Baghdad of the Abbasid Caliphate. The very centre of the city is entirely occupied by the almost empty palaces of the mighty while hoi polloi throng the periphery and travel long distances daily to serve their masters.

Within the charmed circle of inner New Delhi, ministers and members of parliament, the top military brass and the bureaucratic and the judicial elite of the country luxuriate in sprawling bungalows nestling amidst lush greenery in almost sylvan surroundings. ## 5.2.99 English Language: CAT 1997 | Question: 54 top

**Read the passages given below carefully and answer the questions that follow:**

Many surprises lie in store for an academic who strays into the real world. The first such surprise to come my way during a stint as a university administrator related to the photocopying machines within my jurisdiction. I discovered that paper for the machines plus contractual maintenance cost substantially more than photocopies in the private market. This took no account of the other costs of the photocopiers -ink, spare parts, the space occupied by the machine, the interests and depreciation on it, the wages of the machine operator, the loss of time when the machine broke down or the operator absented himself.

The university–and indeed the entire educational system - was in a financial crisis. Here was a situation calling for a quick and painless execution of all white elephants, or so I thought. I proposed that we stop using the photocopying machines and get our photocopies made by a private operator who had rented space from our institution. Further, we could reduce our costs well below the market price through an agreement with the private operator, which would let him run our surplus machines in exchange for a price concession.

I had expected my proposal to be eagerly embraced by an impoverished university. Instead, it created a furore. In a progressive institution like ours, how could I have the temerity to suggest handing over a university asset to the private sector? Perhaps 1 was in the pay of the private operator. Friends and well-wishers emphasised the necessity of immediately distancing myself from any plan that may conceivably benefit a private entrepreneur - even if it should concurrently benefit the university. That, I gathered, was the essence of financial rectitude.

Abashed, I repented my indiscretion. The photocopying machines were of course no longer used, but neither were they transferred to the enemy in the private sector. We got our photocopying done privately at market prices, not the confessional rates I had proposed. The university lost money, but the family silver was saved from the private enemy. After a decently long period gathering dust and cobwebs, it could be sold as scrap, but that would not be during my tenure.

The story of the photocopying machines is repeated in many different guises throughout our public and semipublic institutions. The public sector is replete with unproductive assets, their sterile purity jealously protected from the seductive influences of private enterprise. There are the pathetic load factors in our power plants. There are fleets of public buses lying in idle disrepair in our state transport depots. There is the fertilizer plant, which has never produced even a gram of fertilizer because, after its executive had scoured the wide world in search of the cheapest possible parts, they found that the specifications of these parts did not match each other. There are the 80 gas guzzling staff cars boasted of by a north Indian university which has little else to boast about.

Perhaps the most spectacular instances of unproductive government assets relate to land. Five years ago, the then minister for surface transport, Jadish Tytler, suggested a plan for developing the vast tracts of unused land in the Delhi Transport Corporation's bus depots. He argued, entirely credibly, that by leasing out this land for commercial purposes, the DTC could not only cover its chronic and massive deficit but achieve a substantial surplus. The proposal was never implemented; the infiltration of the private sector into DTC depots was heroically resisted by various government department departments and the corporation continued its relentless plunge deeper into the red.

All other examples of public extravagance, however, pale into insignificance alongside the astronomical wastefulness perpetrated by the New Delhi municipal committee and the design of Edwin Lutyen's Delhi. Delhi unlike all other major cities of the world has a hollow centre – the density of population at the heart of town is negligible. In design, it is no modem metropolis but a medieval imperial capital like the Baghdad of the Abbasid Caliphate. The very centre of the city is entirely occupied by the almost empty palaces of the mighty while hoi polloi throng the periphery and travel long distances daily to serve their masters.

Within the charmed circle of inner New Delhi, ministers and members of parliament, the top military brass and the bureaucratic and the judicial elite of the country luxuriate in sprawling bungalows nestling amidst lush greenery in almost sylvan surroundings. The total land area occupied by these bungalows is one of the best-kept official secrets. The ministry of urban development keeps no count of aggregates, but it appears that there are about 600 bungalows with areas varying from one to 10 acres. A not implausible estimate of the total area is about 10 million square yards.

A conservative estimate of the value of land in central New Delhi is Rs.1, 00, 000 per square yard. Six hundred families of VIPs are occupying real estate worth about Rs.1, 000 billion; at an interest rate bf 12%. This sum would yield an annual income of Rs.120 billion. This amounts to more than one per cent of the gross domestic product.

If the government were to move these six hundred families to the outskirts of the town and lease this land out, say for multi-storied residential construction – subject, of course, to environmental restrictions that would protect the existing greenery – the primary deficit of India would be wiped out.

What is more, rents would drop all over the city and the housing problem of Delhi would be solved, if not fully, at least in substantial measure. Further, there would be a major inward shift of population reducing transport requirements, and making it more lucrative for public transport to ply through inner Delhi. The removal of the six hundred would, at one stroke, relieve the accommodation and transport problems of Delhi as well as the budget deficit of the country. But who would bell the cat? Would the government do it, considering that 600 are the government?

Public interest litigation has of late highlighted a relatively minor aspect of the VIP housing issue: the abuse of ministerial discretion in making out of turn allotments. This focuses attention on the question of a fair distribution between the members of the elite of the fruits of power. In the process, unfortunately, a question of infinitely larger import has been conveniently consigned to oblivion. Doesn't the entire scheme of VIP housing in New Delhi imply organized plunder of the citizenry on a scale quite unprecedented and totally incompatible with the principles of a democratic society?

Strangely enough, this matter has entirely eluded the searchlight of public attention. Political parties, the media public interest litigants, grass root people's movements have all maintained a resounding reticence on the issue. When the excesses perpetrated in the name of VIP security provoked public protest, the Prime Minister desired that VIP security should be made "unobtrusive". VIP housing, however, is an entirely unobtrusive burden on the public, but a burden of quite mind-boggling proportions. Perhaps it is the silent character of this infliction that has made it so easy to impose. Or perhaps centuries of colonial rule have made habitual slaves of us: a mere 50 years of democracy cannot erase our slavish habit of obsequiousness to the imperial state and its rulers.

The Delhi Transport Corporation's relentless plunge deeper into the red continued, because according to the passage:

A. Disposing off 80 gas guzzling staff cars was resisted.
B. Fleets of buses in idle disrepair were not allowed to be sold as scrap.
C. Leasing out unused land for commercial use was strongly resisted.
D. Selling off surplus land to private parties was strongly resisted.

## 5.2.101 English Language: CAT 1997 | Question: 56 top

**Read the passages given below carefully and answer the questions that follow:**

Many surprises lie in store for an academic who strays into the real world. The first such surprise to come my way during a stint as a university administrator related to the photocopying machines within my jurisdiction. I discovered that paper for the machines plus contractual maintenance cost substantially more than photocopies in the private market. This took no account of the other costs of the photocopiers -ink, spare parts, the space occupied by the machine, the interests and depreciation on it, the wages of the machine operator, the loss of time when the machine broke down or the operator absented himself.

The university–and indeed the entire educational system - was in a financial crisis. Here was a situation calling for a quick and painless execution of all white elephants, or so I thought. I proposed that we stop using the photocopying machines and get our photocopies made by a private operator who had rented space from our institution. Further, we could reduce our costs well below the market price through an agreement with the private operator, which would let him run our surplus machines in exchange for a price concession.

I had expected my proposal to be eagerly embraced by an impoverished university. Instead, it created a furore. In a progressive

institution like ours, how could I have the temerity to suggest handing over a university asset to the private sector? Perhaps 1 was in the pay of the private operator. Friends and well-wishers emphasised the necessity of immediately distancing myself from any plan that may conceivably benefit a private entrepreneur - even if it should concurrently benefit the university. That, I gathered, was the essence of financial rectitude.

Abashed, I repented my indiscretion. The photocopying machines were of course no longer used, but neither were they transferred to the enemy in the private sector. We got our photocopying done privately at market prices, not the confessional rates I had proposed. The university lost money, but the family silver was saved from the private enemy. After a decently long period gathering dust and cobwebs, it could be sold as scrap, but that would not be during my tenure.

The story of the photocopying machines is repeated in many different guises throughout our public and semipublic institutions. The public sector is replete with unproductive assets, their sterile purity jealously protected from the seductive influences of private enterprise. There are the pathetic load factors in our power plants. There are fleets of public buses lying in idle disrepair in our state transport depots. There is the fertilizer plant, which has never produced even a gram of fertilizer because, after its executive had scoured the wide world in search of the cheapest possible parts, they found that the specifications of these parts did not match each other. There are the 80 gas guzzling staff cars boasted of by a north Indian university which has little else to boast about.

Perhaps the most spectacular instances of unproductive government assets relate to land. Five years ago, the then minister for surface transport, Jadish Tytler, suggested a plan for developing the vast tracts of unused land in the Delhi Transport Corporation's bus depots. He argued, entirely credibly, that by leasing out this land for commercial purposes, the DTC could not only cover its chronic and massive deficit but achieve a substantial surplus. The proposal was never implemented; the infiltration of the private sector into DTC depots was heroically resisted by various government department departments and the corporation continued its relentless plunge deeper into the red.

All other examples of public extravagance, however, pale into insignificance alongside the astronomical wastefulness perpetrated by the New Delhi municipal committee and the design of Edwin Lutyen's Delhi. Delhi unlike all other major cities of the world has a hollow centre – the density of population at the heart of town is negligible. In design, it is no modem metropolis but a medieval imperial capital like the Baghdad of the Abbasid Caliphate. The very centre of the city is entirely occupied by the almost empty palaces of the mighty while hoi polloi throng the periphery and travel long distances daily to serve their masters.

Within the charmed circle of inner New Delhi, ministers and members of parliament, the top military brass and the bureaucratic and the judicial elite of the country luxuriate in sprawling bungalows nestling amidst lush greenery in almost sylvan surroundings. The total land area occupied by these bungalows is one of the best-kept official secrets. The ministry of urban development keeps no count of aggregates, but it appears that there are about 600 bungalows with areas varying from one to 10 acres. A not implausible estimate of the total area is about 10 million square yards.

A conservative estimate of the value of land in central New Delhi is Rs.1, 00, 000 per square yard. Six hundred families of VIPs are occupying real estate worth about Rs.1, 000 billion; at an interest rate bf 12%. This sum would yield an annual income of Rs.120 billion. This amounts to more than one per cent of the gross domestic product.

If the government were to move these six hundred families to the outskirts of the town and lease this land out, say for multi-storied residential construction – subject, of course, to environmental restrictions that would protect the existing greenery – the primary deficit of India would be wiped out.

What is more, rents would drop all over the city and the housing problem of Delhi would be solved, if not fully, at least in substantial measure. Further, there would be a major inward shift of population reducing transport requirements, and making it more lucrative for public transport to ply through inner Delhi. The removal of the six hundred would, at one stroke, relieve the accommodation and transport problems of Delhi as well as the budget deficit of the country. But who would bell the cat? Would the government do it, considering that 600 are the government?

Public interest litigation has of late highlighted a relatively minor aspect of the VIP housing issue: the abuse of ministerial discretion in making out of turn allotments. This focuses attention on the question of a fair distribution between the members of the elite of the fruits of power. In the process, unfortunately, a question of infinitely larger import has been conveniently consigned to oblivion. Doesn't the entire scheme of VIP housing in New Delhi imply organized plunder of the citizenry on a scale quite unprecedented and totally incompatible with the principles of a democratic society?

Strangely enough, this matter has entirely eluded the searchlight of public attention. Political parties, the media public interest litigants, grass root people's movements have all maintained a resounding reticence on the issue. When the excesses perpetrated in the name of VIP security provoked public protest, the Prime Minister desired that VIP security should be made "unobtrusive". VIP housing, however, is an entirely unobtrusive burden on the public, but a burden of quite mind-boggling proportions. Perhaps it is the silent character of this infliction that has made it so easy to impose. Or perhaps centuries of colonial rule have made habitual slaves of us: a mere 50 years of democracy cannot erase our slavish habit of obsequiousness to the imperial state and its rulers.

The author's proposal to lease out the land occupied by bungalows for multi-store dyed residential construction would:

A. Spoil the ecology of inner New Delhi
B. Wipe out the primary deficit of India
C. Create a surplus of Rs.120 billion for the Municipal Committee.

D. Enhance the greenery of the inner city.

## 5.2.102 English Language: CAT 1997 | Question: 56 top

Read the passages given below carefully and answer the questions that follow.

Many surprises lie in store for an academic who strays into the real world. The first such surprise to come my way during a stint as a university administrator related to the photocopying machines within my jurisdiction. I discovered that paper for the machines plus contractual maintenance cost substantially more than photocopies in the private market. This took no account of the other costs of the photocopiers -ink, spare parts, the space occupied by the machine, the interests and depreciation on it, the wages of the machine operator, the loss of time when the machine broke down or the operator absented himself.

The university–and indeed the entire educational system - was in a financial crisis. Here was a situation calling for a quick and painless execution of all white elephants, or so I thought. I proposed that we stop using the photocopying machines and get our photocopies made by a private operator who had rented space from our institution. Further, we could reduce our costs well below the market price through an agreement with the private operator, which would let him run our surplus machines in exchange for a price concession.

I had expected my proposal to be eagerly embraced by an impoverished university. Instead, it created a furore. In a progressive institution like ours, how could I have the temerity to suggest handing over a university asset to the private sector? Perhaps 1 was in the pay of the private operator. Friends and well-wishers emphasised the necessity of immediately distancing myself from any plan that may conceivably benefit a private entrepreneur - even if it should concurrently benefit the university. That, I gathered, was the essence of financial rectitude.

Abashed, I repented my indiscretion. The photocopying machines were of course no longer used, but neither were they transferred to the enemy in the private sector. We got our photocopying done privately at market prices, not the confessional rates I had proposed. The university lost money, but the family silver was saved from the private enemy. After a decently long period gathering dust and cobwebs, it could be sold as scrap, but that would not be during my tenure.

The story of the photocopying machines is repeated in many different guises throughout our public and semipublic institutions. The public sector is replete with unproductive assets, their sterile purity jealously protected from the seductive influences of private enterprise. There are the pathetic load factors in our power plants. There are fleets of public buses lying in idle disrepair in our state transport depots. There is the fertilizer plant, which has never produced even a gram of fertilizer because, after its executive had scoured the wide world in search of the cheapest possible parts, they found that the specifications of these parts did not match each other. There are the 80 gas guzzling staff cars boasted of by a north Indian university which has little else to boast about.

Perhaps the most spectacular instances of unproductive government assets relate to land. Five years ago, the then minister for surface transport, Jadish Tytler, suggested a plan for developing the vast tracts of unused land in the Delhi Transport Corporation's bus depots. **5.2.105 English Language: CAT 1997 | Question: 58** top

**Read the passages given below carefully and answer the questions that follow:**

Many surprises lie in store for an academic who strays into the real world. The first such surprise to come my way during a stint as a university administrator related to the photocopying machines within my jurisdiction. I discovered that paper for the machines plus contractual maintenance cost substantially more than photocopies in the private market. This took no account of the other costs of the photocopiers -ink, spare parts, the space occupied by the machine, the interests and depreciation on it, the wages of the machine operator, the loss of time when the machine broke down or the operator absented himself.

The university–and indeed the entire educational system - was in a financial crisis. Here was a situation calling for a quick and painless execution of all white elephants, or so I thought. I proposed that we stop using the photocopying machines and get our photocopies made by a private operator who had rented space from our institution. Further, we could reduce our costs well below the market price through an agreement with the private operator, which would let him run our surplus machines in exchange for a price concession.

I had expected my proposal to be eagerly embraced by an impoverished university. Instead, it created a furore. In a progressive institution like ours, how could I have the temerity to suggest handing over a university asset to the private sector? Perhaps 1 was in the pay of the private operator. Friends and well-wishers emphasised the necessity of immediately distancing myself from any plan that may conceivably benefit a private entrepreneur - even if it should concurrently benefit the university. That, I gathered, was the essence of financial rectitude.

Abashed, I repented my indiscretion. The photocopying machines were of course no longer used, but neither were they transferred to the enemy in the private sector. We got our photocopying done privately at market prices, not the confessional rates I had proposed. The university lost money, but the family silver was saved from the private enemy. After a decently long period gathering dust and cobwebs, it could be sold as scrap, but that would not be during my tenure.

The story of the photocopying machines is repeated in many different guises throughout our public and semipublic institutions. The public sector is replete with unproductive assets, their sterile purity jealously protected from the seductive influences of private enterprise. There are the pathetic load factors in our power plants. There are fleets of public buses lying in idle disrepair in our state transport depots. There is the fertilizer plant, which has never produced even a gram of fertilizer because, after its executive had scoured the wide world in search of the cheapest possible parts, they found that the specifications of these parts did not match each other. There are the 80 gas guzzling staff cars boasted of by a north Indian university which has little else to boast about.

Perhaps the most spectacular instances of unproductive government assets relate to land. Five years ago, the then minister for surface transport, Jadish Tytler, suggested a plan for developing the vast tracts of unused land in the Delhi Transport Corporation's bus depots. He argued, entirely credibly, that by leasing out this land for commercial purposes, the DTC could not only cover its chronic and massive deficit but achieve a substantial surplus. The proposal was never implemented; the infiltration of the private sector into DTC depots was heroically resisted by various government department departments and the corporation continued its relentless plunge deeper into the red.

All other examples of public extravagance, however, pale into insignificance alongside the astronomical wastefulness perpetrated by the New Delhi municipal committee and the design of Edwin Lutyen's Delhi. Delhi unlike all other major cities of the world has a hollow centre – the density of population at the heart of town is negligible. In design, it is no modem metropolis but a medieval imperial capital like the Baghdad of the Abbasid Caliphate. The very centre of the city is entirely occupied by the almost empty palaces of the mighty while hoi polloi throng the periphery and travel long distances daily to serve their masters.

Within the charmed circle of inner New Delhi, ministers and members of parliament, the top military brass and the bureaucratic and the judicial elite of the country luxuriate in sprawling bungalows nestling amidst lush greenery in almost sylvan surroundings. The total land area occupied by these bungalows is one of the best-kept official secrets. The ministry of urban development keeps no count of aggregates, but it appears that there are about 600 bungalows with areas varying from one to 10 acres. A not implausible estimate of the total area is about 10 million square yards.

A conservative estimate of the value of land in central New Delhi is Rs.1, 00, 000 per square yard. Six hundred families of VIPs are occupying real estate worth about Rs.1, 000 billion; at an interest rate bf 12%. This sum would yield an annual income of Rs.120 billion. This amounts to more than one per cent of the gross domestic product.

If the government were to move these six hundred families to the outskirts of the town and lease this land out, say for multi-storied residential construction – subject, of course, to environmental restrictions that would protect the existing greenery – the primary deficit of India would be wiped out.

What is more, rents would drop all over the city and the housing problem of Delhi would be solved, if not fully, at least in substantial measure. Further, there would be a major inward shift of population reducing transport requirements, and making it more lucrative for public transport to ply through inner Delhi. The removal of the six hundred would, at one stroke, relieve the accommodation and transport problems of Delhi as well as the budget deficit of the country. But who would bell the cat? Would the government do it, considering that 600 are the government?

Public interest litigation has of late highlighted a relatively minor aspect of the VIP housing issue: the abuse of ministerial discretion in making out of turn allotments. This focuses attention on the question of a fair distribution between the members of the elite of the fruits of power. In the process, unfortunately, a question of infinitely larger import has been conveniently consigned to oblivion. Doesn't the entire scheme of VIP housing in New Delhi imply organized plunder of the citizenry on a scale quite unprecedented and totally incompatible with the principles of a democratic society?

Strangely enough, this matter has entirely eluded the searchlight of public attention. Political parties, the media public interest litigants, grass root people's movements have all maintained a resounding reticence on the issue. When the excesses perpetrated in the name of VIP security provoked public protest, the Prime Minister desired that VIP security should be made "unobtrusive". VIP housing, however, is an entirely unobtrusive burden on the public, but a burden of quite mind-boggling proportions. Perhaps it is the silent character of this infliction that has made it so easy to impose. Or perhaps centuries of colonial rule have made habitual slaves of us: a mere 50 years of democracy cannot erase our slavish habit of obsequiousness to the imperial state and its rulers.

When the author talks about an unobtrusive public burden of mind-boggling proportions, he is referring to the issue of:

A. VIP housing
B. VIP security
C. Out of turn allotment of housing to VIPs.
D. Unproductive public assets.

## 5.2.106 English Language: CAT 1997 | Question: 58 top

Read the passages given below carefully and answer the questions that follow.

Many surprises lie in store for an academic who strays into the real world. The first such surprise to come my way during a stint as a university administrator related to the photocopying machines within my jurisdiction. I discovered that paper for the machines plus contractual maintenance cost substantially more than photocopies in the private market. This took no account of the other costs of the photocopiers -ink, spare parts, the space occupied by the machine, the interests and depreciation on it, the wages of the machine operator, the loss of time when the machine broke down or the operator absented himself.

The university–and indeed the entire educational system - was in a financial crisis. Here was a situation calling for a quick and painless execution of all white elephants, or so I thought. I proposed that we stop using the photocopying machines and get our photocopies made by a private operator who had rented space from our institution. Further, we could reduce our costs well below the market price through an agreement with the private operator, which would let him run our surplus machines in exchange for a price concession.

I had expected my proposal to be eagerly embraced by an impoverished university. Instead, it created a furore. In a progressive institution like ours, how could I have the temerity to suggest handing over a university asset to the private sector? Perhaps 1 was in the pay of the private operator. Friends and well-wishers emphasised the necessity of immediately distancing myself from any plan that may conceivably benefit a private entrepreneur - even if it should concurrently benefit the university. That, I gathered, was the essence of financial rectitude.

Abashed, I repented my indiscretion. The photocopying machines were of course no longer used, but neither were they transferred to the enemy in the private sector. We got our photocopying done privately at market prices, not the confessional rates I had proposed. The university lost money, but the family silver was saved from the private enemy. After a decently long period gathering dust and cobwebs, it could be sold as scrap, but that would not be during my tenure.

The story of the photocopying machines is repeated in many different guises throughout our public and semipublic institutions. The public sector is replete with unproductive assets, their sterile purity jealously protected from the seductive influences of private enterprise. There are the pathetic load factors in our power plants. There are fleets of public buses lying in idle disrepair in our state transport depots. There is the fertilizer plant, which has never produced even a gram of fertilizer because, after its executive had scoured the wide world in search of the cheapest possible parts, they found that the specifications of these parts did not match each other. There are the 80 gas guzzling staff cars boasted of by a north Indian university which has little else to boast about.

Perhaps the most spectacular instances of unproductive government assets relate to land. Five years ago, the then minister for surface transport, Jadish Tytler, suggested a plan for developing the vast tracts of unused land in the Delhi Transport Corporation's bus depots. He argued, entirely credibly, that by leasing out this land for commercial purposes, the DTC could not only cover its chronic and massive deficit but achieve a substantial surplus. The proposal was never implemented; the infiltration of the private sector into DTC depots was heroically resisted by various government department departments and the corporation continued its relentless plunge deeper into the red.

All other examples of public extravagance, however, pale into insignificance alongside the astronomical wastefulness perpetrated by the New Delhi municipal committee and the design of Edwin Lutyen's Delhi. Delhi unlike all other major cities of the world has a hollow centre – the density of population at the heart of town is negligible. In design, it is no modem metropolis but a medieval imperial capital like the Baghdad of the Abbasid Caliphate. The very centre of the city is entirely occupied by the almost empty palaces of the mighty while hoi polloi throng the periphery and travel long distances daily to serve their masters.

Within the charmed circle of inner New Delhi, ministers and members of parliament, the top military brass and the bureaucratic and the judicial elite of the country luxuriate in sprawling bungalows nestling amidst lush greenery in almost sylvan surroundings. The total land area occupied by these bungalows is one of the best-kept official secrets. The ministry of urban development keeps no count of aggregates, but it appears that there are about 600 bungalows with areas varying from one to 10 acres. A not implausible estimate of the total area is about 10 million square yards.

A conservative estimate of the value of land in central New Delhi is Rs.1, 00, 000 per square yard. Six hundred families of

VIPs are occupying real estate worth about Rs.1, 000 billion; at an interest rate bf 12%. This sum would yield an annual income of Rs.120 billion. This amounts to more than one per cent of the gross domestic product.

If the government were to move these six hundred families to the outskirts of the town and lease this land out, say for multi-storied residential construction – subject, of course, to environmental restrictions that would protect the existing greenery – the primary deficit of India would be wiped out.

What is more, rents would drop all over the city and the housing problem of Delhi would be solved, if not fully, at least in substantial measure. Further, there would be a major inward shift of population reducing transport requirements, and making it more lucrative for public transport to ply through inner Delhi. The removal of the six hundred would, at one stroke, relieve the accommodation and transport problems of Delhi as well as the budget deficit of the country. But who would bell the cat? Would the government do it, considering that 600 are the government?

Public interest litigation has of late highlighted a relatively minor aspect of the VIP housing issue: the abuse of ministerial discretion in making out of turn allotments. This focuses attention on the question of a fair distribution between the members of the elite of the fruits of power. In the process, unfortunately, a question of infinitely larger import has been conveniently consigned to oblivion. Doesn't the entire scheme of VIP housing in New Delhi imply organized plunder of the citizenry on a scale quite unprecedented and totally incompatible with the principles of a democratic society?

Strangely enough, this matter has entirely eluded the searchlight of public attention. Political parties, the media public interest litigants, grass root people's movements have all maintained a resounding reticence on the issue. When the excesses perpetrated in the name of VIP security provoked public protest, the Prime Minister desired that VIP security should be made "unobtrusive". VIP housing, however, is an entirely unobtrusive burden on the public, but a burden of quite mind-boggling proportions. Perhaps it is the silent character of this infliction that has made it so easy to impose. Or perhaps centuries of colonial rule have made habitual slaves of us: a mere 50 years of democracy cannot erase our slavish habit of obsequiousness to the imperial state and its rulers.

When the author talks about an unobtrusive public burden of mind-boggling proportions, he is referring to the issue of:

A. VIP housing
B. VIP security
C. Out of turn allotment of housing to VIPs.
D. Unproductive public assets.

## 5.2.107 English Language: CAT 1997 | Question: 59 top

Read the passages given below carefully and answer the questions that follow.

Many surprises lie in store for an academic who strays into the real world. The first such surprise to come my way during a stint as a university administrator related to the photocopying machines within my jurisdiction. I discovered that paper for the machines plus contractual maintenance cost substantially more than photocopies in the private market. This took no account of the other costs of the photocopiers -ink, spare parts, the space occupied by the machine, the interests and depreciation on it, the wages of the machine operator, the loss of time when the machine broke down or the operator absented himself.

The university–and indeed the entire educational system - was in a financial crisis. Here was a situation calling for a quick and painless execution of all white elephants, or so I thought. I proposed that we stop using the photocopying machines and get our photocopies made by a private operator who had rented space from our institution. Further, we could reduce our costs well below the market price through an agreement with the private operator, which would let him run our surplus machines in exchange for a price concession.

I had expected my proposal to be eagerly embraced by an impoverished university. Instead, it created a furore. In a progressive institution like ours, how could I have the temerity to suggest handing over a university asset to the private sector? Perhaps 1 was in the pay of the private operator. Friends and well-wishers emphasised the necessity of immediately distancing myself from any plan that may conceivably benefit a private entrepreneur - even if it should concurrently benefit the university. That, I gathered, was the essence of financial rectitude.

Abashed, I repented my indiscretion. The photocopying machines were of course no longer used, but neither were they transferred to the enemy in the private sector. We got our photocopying done privately at market prices, not the confessional rates I had proposed. The university lost money, but the family silver was saved from the private enemy. After a decently long period gathering dust and cobwebs, it could be sold as scrap, but that would not be during my tenure.

## 5.2.108 English Language: CAT 1997 | Question: 59 top

**Read the passages given below carefully and answer the questions that follow:**

Many surprises lie in store for an academic who strays into the real world. The first such surprise to come my way during a stint as a university administrator related to the photocopying machines within my jurisdiction. I discovered that paper for the machines plus contractual maintenance cost substantially more than photocopies in the private market. This took no account of the other costs of the photocopiers -ink, spare parts, the space occupied by the machine, the interests and depreciation on it, the wages of the machine operator, the loss of time when the machine broke down or the operator absented himself.

The university–and indeed the entire educational system - was in a financial crisis. Here was a situation calling for a quick and painless execution of all white elephants, or so I thought. I proposed that we stop using the photocopying machines and get our photocopies made by a private operator who had rented space from our institution. Further, we could reduce our costs well below the market price through an agreement with the private operator, which would let him run our surplus machines in exchange for a price concession.

I had expected my proposal to be eagerly embraced by an impoverished university. Instead, it created a furore. In a progressive

institution like ours, how could I have the temerity to suggest handing over a university asset to the private sector? Perhaps 1 was in the pay of the private operator. Friends and well-wishers emphasised the necessity of immediately distancing myself from any plan that may conceivably benefit a private entrepreneur - even if it should concurrently benefit the university. That, I gathered, was the essence of financial rectitude.

Abashed, I repented my indiscretion. The photocopying machines were of course no longer used, but neither were they transferred to the enemy in the private sector. We got our photocopying done privately at market prices, not the confessional rates I had proposed. The university lost money, but the family silver was saved from the private enemy. After a decently long period gathering dust and cobwebs, it could be sold as scrap, but that would not be during my tenure.

The story of the photocopying machines is repeated in many different guises throughout our public and semipublic institutions. The public sector is replete with unproductive assets, their sterile purity jealously protected from the seductive influences of private enterprise. There are the pathetic load factors in our power plants. There are fleets of public buses lying in idle disrepair in our state transport depots. There is the fertilizer plant, which has never produced even a gram of fertilizer because, after its executive had scoured the wide world in search of the cheapest possible parts, they found that the specifications of these parts did not match each other. There are the 80 gas guzzling staff cars boasted of by a north Indian university which has little else to boast about.

Perhaps the most spectacular instances of unproductive government assets relate to land. Five years ago, the then minister for surface transport, Jadish Tytler, suggested a plan for developing the vast tracts of unused land in the Delhi Transport Corporation's bus depots. He argued, entirely credibly, that by leasing out this land for commercial purposes, the DTC could not only cover its chronic and massive deficit but achieve a substantial surplus. The proposal was never implemented; the infiltration of the private sector into DTC depots was heroically resisted by various government department departments and the corporation continued its relentless plunge deeper into the red.

All other examples of public extravagance, however, pale into insignificance alongside the astronomical wastefulness perpetrated by the New Delhi municipal committee and the design of Edwin Lutyen's Delhi. Delhi unlike all other major cities of the world has a hollow centre – the density of population at the heart of town is negligible. In design, it is no modem metropolis but a medieval imperial capital like the Baghdad of the Abbasid Caliphate. The very centre of the city is entirely occupied by the almost empty palaces of the mighty while hoi polloi throng the periphery and travel long distances daily to serve their masters.

Within the charmed circle of inner New Delhi, ministers and members of parliament, the top military brass and the bureaucratic and the judicial elite of the country luxuriate in sprawling bungalows nestling amidst lush greenery in almost sylvan surroundings. The total land area occupied by these bungalows is one of the best-kept official secrets. The ministry of urban development keeps no count of aggregates, but it appears that there are about 600 bungalows with areas varying from one to 10 acres. A not implausible estimate of the total area is about 10 million square yards.

A conservative estimate of the value of land in central New Delhi is Rs.1, 00, 000 per square yard. Six hundred families of VIPs are occupying real estate worth about Rs.1, 000 billion; at an interest rate bf 12%. This sum would yield an annual income of Rs.120 billion. This amounts to more than one per cent of the gross domestic product.

If the government were to move these six hundred families to the outskirts of the town and lease this land out, say for multi-storied residential construction – subject, of course, to environmental restrictions that would protect the existing greenery – the primary deficit of India would be wiped out.

What is more, rents would drop all over the city and the housing problem of Delhi would be solved, if not fully, at least in substantial measure. Further, there would be a major inward shift of population reducing transport requirements, and making it more lucrative for public transport to ply through inner Delhi. The removal of the six hundred would, at one stroke, relieve the accommodation and transport problems of Delhi as well as the budget deficit of the country. But who would bell the cat? Would the government do it, considering that 600 are the government?

Public interest litigation has of late highlighted a relatively minor aspect of the VIP housing issue: the abuse of ministerial discretion in making out of turn allotments. This focuses attention on the question of a fair distribution between the members of the elite of the fruits of power. In the process, unfortunately, a question of infinitely larger import has been conveniently consigned to oblivion. Doesn't the entire scheme of VIP housing in New Delhi imply organized plunder of the citizenry on a scale quite unprecedented and totally incompatible with the principles of a democratic society?

Strangely enough, this matter has entirely eluded the searchlight of public attention. Political parties, the media public interest litigants, grass root people's movements have all maintained a resounding reticence on the issue. When the excesses perpetrated in the name of VIP security provoked public protest, the Prime Minister desired that VIP security should be made "unobtrusive". VIP housing, however, is an entirely unobtrusive burden on the public, but a burden of quite mind-boggling proportions. Perhaps it is the silent character of this infliction that has made it so easy to impose. ## 5.2.111 English Language: CAT 1997 | Question: 61 top

**Read the passages given below carefully and answer the questions that follow:**

When talk turns to how India has done for itself in 50 years of independence, the world has nothing but praise for our success in remaining a democracy. On other fronts, the applause is less loud. In absolute terms, India hasn't done too. Badly, of course. Life expectancy has increased. So has literacy. Industry, which was barely a fledgeling, has grown tremendously. And as far as agriculture is concerned, India has been transformed from a country perpetually on the edge of starvation into a success story held up for others to emulate.

But these are competitive times when change is rapid, and to walk slowly when the rest of the world is running is almost as bad as standing still or walking backwards. Compared with large chunks of what was then the developing world – South Korea, Singapore, Malaysia, Thailand, Indonesia, China and what was till lately a separate Hong Kong – India has fared abysmally.

It began with a far better infrastructure than most of these countries had. It suffered hardly or not at all during the Second World War. It had advantages like an English speaking elite, quality scientific manpower (including a Nobel laureate and others who could be ranked among the world's best) and excellent business acumen. Yet, today, when countries are ranked according to their global competitiveness, it is tiny Singapore that figures at the top. Hong Kong is an export powerhouse. So is Taiwan. If a symbol were needed of how far we have fallen back, note that while Korean Cielos are sold in India, no one in South Korea is rushing to buy an Indian car.

The reasons list themselves. Topmost is economic isolationism. The government discouraged imports and encouraged self-sufficiency. Whatever the aim was, the result was the creation of a totally inefficient industry that failed to keep pace with global trends and, therefore, became absolutely uncompetitive. Only when the trade gates opened a little did this become apparent. The years since then have been spent in merely trying to catch up.

That the government actually sheltered its industrialists from foreign competition is a little strange. For, in all other respects, it operated under the conviction that businessmen were little more than crooks who were to be prevented from entering the most important areas of the economy, who were to be hamstrung in as many ways as possible, who were to be tolerated in the same way as an in excisable wart. The high, expropriatory rates of taxation, the licensing laws, the reservation of whole swathes of industry for the public sector, and the granting of monopolies to the public sector firms were the principal manifestations of this attitude. The government forgot that before wealth could be distributed, it had to be created. The government forgot that it itself could not create, only squander wealth.

Some of the manifestations of the old attitude have changed. Tax rates have fallen. Licensing has been all but abolished. And the gates of global trade have been opened wide. But most of these changes were forced by circumstances, partly by the foreign exchange bankruptcy of 1991 and by the recognition that the government could no longer muster the funds to support the public sector, leave alone expand it. Whether the attitude of the government itself, or that of more than handful of ministers, has changed is open to question.

In many other ways, however, the government has not changed one whit. Business still has to negotiate a welter of negotiations. Transparency is still a long way off. And there is no exit policy. In defending the existing policy, politicians betray an inability to see beyond their noses. A no-exit policy for labour is equivalent to a no-entry policy for new business. If one industry is not allowed to retrench labour, other industries will think a hundred times before employing new labour.

In other ways too, the government hurts industries. Public sector monopolies like the department of telecommunications and Videsh Sanchar Nigam make it possible for Indian businesses to operate only at a cost several times that of their counterparts abroad. The infrastructure is in a shambles partly because it is unable to formulate a sufficiently remunerative policy for private business, and partly because it does not have the stomach to charge market rates for services.

After a burst of activity in the early nineties, the government is dragging its feet. At the rate it is going, it will be another 50 years before the government realises that a pro- business policy is the best pro-people policy. By then, of course, the world would have moved even farther ahead.

The writer's attitude towards the government is:

A. Critical B. Ironical C. Sarcastic D. Derisive

But most of these changes were forced by circumstances, partly by the foreign exchange bankruptcy of 1991 and by the recognition that the government could no longer muster the funds to support the public sector, leave alone expand it. Whether the attitude of the government itself, or that of more than handful of ministers, has changed is open to question.

In many other ways, however, the government has not changed one whit. Business still has to negotiate a welter of negotiations. Transparency is still a long way off. And there is no exit policy. In defending the existing policy, politicians betray an inability to see beyond their noses. A no-exit policy for labour is equivalent to a no-entry policy for new business. If one industry is not allowed to retrench labour, other industries will think a hundred times before employing new labour.

In other ways too, the government hurts industries. Public sector monopolies like the department of telecommunications and Videsh Sanchar Nigam make it possible for Indian businesses to operate only at a cost several times that of their counterparts

abroad. The infrastructure is in a shambles partly because it is unable to formulate a sufficiently remunerative policy for private business, and partly because it does not have the stomach to charge market rates for services.

After a burst of activity in the early nineties, the government is dragging its feet. At the rate it is going, it will be another 50 years before the government realises that a pro- business policy is the best pro-people policy. By then, of course, the world would have moved even farther ahead.

The writer is surprised at the government's attitude towards its industrialists because:

A. The government did not need to protect its industrialists.
B. The issue of competition was nonexistent.
C. The government looked upon its industrialists as crooks
D. The attitude was a conundrum.

## 5.2.113 English Language: CAT 1997 | Question: 63 top

**Read the passages given below carefully and answer the questions that follow:**

When talk turns to how India has done for itself in 50 years of independence, the world has nothing but praise for our success in remaining a democracy. On other fronts, the applause is less loud. In absolute terms, India hasn't done too. Badly, of course. Life expectancy has increased. So has literacy. Industry, which was barely a fledgeling, has grown tremendously. And as far as agriculture is concerned, India has been transformed from a country perpetually on the edge of starvation into a success story held up for others to emulate.

But these are competitive times when change is rapid, and to walk slowly when the rest of the world is running is almost as bad as standing still or walking backwards. Compared with large chunks of what was then the developing world – South Korea, Singapore, Malaysia, Thailand, Indonesia, China and what was till lately a separate Hong Kong – India has fared abysmally.

It began with a far better infrastructure than most of these countries had. It suffered hardly or not at all during the Second World War. It had advantages like an English speaking elite, quality scientific manpower (including a Nobel laureate and others who could be ranked among the world's best) and excellent business acumen. Yet, today, when countries are ranked according to their global competitiveness, it is tiny Singapore that figures at the top. Hong Kong is an export powerhouse. So is Taiwan. If a symbol were needed of how far we have fallen back, note that while Korean Cielos are sold in India, no one in South Korea is rushing to buy an Indian car.

The reasons list themselves. Topmost is economic isolationism. The government discouraged imports and encouraged self-sufficiency. Whatever the aim was, the result was the creation of a totally inefficient industry that failed to keep pace with global trends and, therefore, became absolutely uncompetitive. Only when the trade gates opened a little did this become apparent. The years since then have been spent in merely trying to catch up.

That the government actually sheltered its industrialists from foreign competition is a little strange. For, in all other respects, it operated under the conviction that businessmen were little more than crooks who were to be prevented from entering the most important areas of the economy, who were to be hamstrung in as many ways as possible, who were to be tolerated in the same way as an in excisable wart. The high, expropriatory rates of taxation, the licensing laws, the reservation of whole swathes of industry for the public sector, and the granting of monopolies to the public sector firms were the principal manifestations of this attitude. The government forgot that before wealth could be distributed, it had to be created. The government forgot that it itself could not create, only squander wealth.

Some of the manifestations of the old attitude have changed. Tax rates have fallen. Licensing has been all but abolished. And the gates of global trade have been opened wide. But most of these changes were forced by circumstances, partly by the foreign exchange bankruptcy of 1991 and by the recognition that the government could no longer muster the funds to support the public sector, leave alone expand it. Whether the attitude of the government itself, or that of more than handful of ministers, has changed is open to question.

In many other ways, however, the government has not changed one whit. Business still has to negotiate a welter of negotiations. Transparency is still a long way off. And there is no exit policy. In defending the existing policy, politicians betray an inability to see beyond their noses. A no-exit policy for labour is equivalent to a no-entry policy for new business. If one industry is not allowed to retrench labour, other industries will think a hundred times before employing new labour.

In other ways too, the government hurts industries. And as far as agriculture is concerned, India has been transformed from a country perpetually on the edge of starvation into a success story held up for others to emulate.

But these are competitive times when change is rapid, and to walk slowly when the rest of the world is running is almost as bad as standing still or walking backwards. Compared with large chunks of what was then the developing world – South Korea, Singapore, Malaysia, Thailand, Indonesia, China and what was till lately a separate Hong Kong – India has fared abysmally.

It began with a far better infrastructure than most of these countries had. It suffered hardly or not at all during the Second World War. It had advantages like an English speaking elite, quality scientific manpower (including a Nobel laureate and others who could be ranked among the world's best) and excellent business acumen. Yet, today, when countries are ranked according to their global competitiveness, it is tiny Singapore that figures at the top. Hong Kong is an export powerhouse. So is Taiwan. If a symbol were needed of how far we have fallen back, note that while Korean Cielos are sold in India, no one in South Korea is rushing to buy an Indian car.

The reasons list themselves. Topmost is economic isolationism. The government discouraged imports and encouraged self-sufficiency. Whatever the aim was, the result was the creation of a totally inefficient industry that failed to keep pace with global trends and, therefore, became absolutely uncompetitive. Only when the trade gates opened a little did this become apparent. The years since then have been spent in merely trying to catch up.

That the government actually sheltered its industrialists from foreign competition is a little strange. For, in all other respects, it operated under the conviction that businessmen were little more than crooks who were to be prevented from entering the most important areas of the economy, who were to be hamstrung in as many ways as possible, who were to be tolerated in the same way as an in excisable wart. The high, expropriatory rates of taxation, the licensing laws, the reservation of whole swathes of industry for the public sector, and the granting of monopolies to the public sector firms were the principal manifestations of this attitude. The government forgot that before wealth could be distributed, it had to be created. The government forgot that it itself could not create, only squander wealth.

Some of the manifestations of the old attitude have changed. Tax rates have fallen. Licensing has been all but abolished. And the gates of global trade have been opened wide. But most of these changes were forced by circumstances, partly by the foreign exchange bankruptcy of 1991 and by the recognition that the government could no longer muster the funds to support the public sector, leave alone expand it. Whether the attitude of the government itself, or that of more than handful of ministers, has changed is open to question.

In many other ways, however, the government has not changed one whit. Business still has to negotiate a welter of negotiations. Transparency is still a long way off. And there is no exit policy. In defending the existing policy, politicians betray an inability to see beyond their noses. A no-exit policy for labour is equivalent to a no-entry policy for new business. If one industry is not allowed to retrench labour, other industries will think a hundred times before employing new labour.

In other ways too, the government hurts industries. Public sector monopolies like the department of telecommunications and Videsh Sanchar Nigam make it possible for Indian businesses to operate only at a cost several times that of their counterparts abroad. The infrastructure is in a shambles partly because it is unable to formulate a sufficiently remunerative policy for private business, and partly because it does not have the stomach to charge market rates for services.

After a burst of activity in the early nineties, the government is dragging its feet. At the rate it is going, it will be another 50 years before the government realises that a pro- business policy is the best pro-people policy. By then, of course, the world would have moved even farther ahead.

According to the writer:

A. India's politicians are myopic in their vision of the country's requirements.
B. India's politicians are busy lining their pockets.
C. India's politicians are not conversant with the needs of the present scenario.
D. All of the above.

## 5.2.121 English Language: CAT 1997 | Question: 71 top

**Read the passages given below carefully and answer the questions that follow:**

The new form of direct marketing is a big step up from today's crude version. But it is also in some ways a step backwards. The first direct marketers were trusted, local shopkeepers. Compared with today's direct marketers, whose best stab at intimacy is a pre-printed letter with a misspelt name, the local shopkeeper really knew his customers – remembering when to order a favourite bolt of fabric for one, suggesting a new cough tincture to another. "He carried his database in his head", says Don Peppers, who with Martha Rogers was an early advocate of personalised marketing.

The transformation of direct marketing from its local origins into advertising's downmarket cousin dates from the birth of mass production, which enabled manufacturers to produce goods in large quantities for sale by chain stores to unseen buyers. The first mass produced shoes in America were called "straights", with identical shapes for left and right feet. Lester Wunderman, inventor of the term "direct marketing", believes that mass production has conditioned consumers to expect unsatisfactory service and goods. "It created a culture of things that didn't quite fit, didn't quite suit and didn't quite serve", he says.

With mass retailing came mass advertising. Without direct contact with the consumer, manufacturers could not know who was buying what; only what was selling. Mass advertising established a link between a product and millions of faceless consumers. Brands – encapsulating a short, memorable message – were part of this relationship. The result has in many cases been fantastically successful: Coca-Cola has created an image that is instantly recognised and even has emotional resonance.

Yet branding is, at best, an imprecise art. Most consumers would be hard-pressed to explain why, say, Levis or Nike are losing cachet to such newcomers as Tommy Hilfiger. Because they sell through huge retailers, producers struggle to know why customers buy their brands. As advertising costs have risen and the media have fragmented, mass marketing has become harder and more costly. That, plus new computer technology has pushed direct marketing into the limelight. Its full potential is only just being grasped. By manipulating information, including data over the Internet, direct marketing can be targeted and personalised. It can even be intelligent–learning what customers like from what they buy and where they browse, as well as soliciting feedback via the telephone and e-mail. The result can be more effective than mass advertising.

The low costs of direct marketing have created a huge and fast-growing industry–made up of direct mail, telemarketing, database marketing, the Internet and free phone TV, radio and print advertisements. In its biggest market, North America, the industry was worth $'163 billion in 1998, when it grew by 7% to almost three-fifths of the country's total spending on advertising. The industry expects 7% annual growth to 2002, beating the 5.5% forecast for advertising spending

Direct marketing is growing even faster in places where junk mail is new enough still to be welcome. Robert Wientzen, president of America's Direct Marketing Association, says that in Russian and the Czech Republic most junk mail is opened and read – indeed the average piece is pored over by more than one person. Even in China, despite an unreliable postal service and few credit cards, the government in encouraging direct marketing, partly to stop people migrating to cities in search of things to buy.

Yet most direct marketing remains clumsy. Britain's Direct Marketing Association admits its members spend $30, 000 (dollar 49, 000) a year sending mailings to dead people. Typical success rates for most mailshot campaigns in mature countries are no better than 2%. Steve Dapper, chief executive of Rupp Collins, a big direct marketing agency, complaints that consumer data are sold too freely, leading to pesky cold calls and junk mail. The trouble is that direct marketing is still driven by the same thinking as mass marketing.

Most direct marketing is based on profiles built by classification systems that use a mixture of census data, questionnaires, and electoral roll information and, in America, credit- card data to segment populations. This information is passed to a direct marketing agency to slice into profiles. Having defined a type, the agency buys the names and addresses of similar people from mailing lists sold by list brokers. The profiles are not sophisticated. Scott Adms, creator of the Dibert cartoons, jokes that the most important category is "the Stupid Rich", so named because of their tendency to buy anything that's new, regardless of cost or usefulness. If you sell enough to them, he says, you can afford to sell the rest to "The Stupid Poor".

Why is today's direct marketing called crude?

A. It is a crude attempt to become intimate with the customer.
B. It is unlike the shopkeepers of the past.

C. It is a crude method to sell things.
D. It is not sophisticated as mass marketing.

If you sell enough to them, he says, you can afford to sell the rest to "The Stupid Poor".

Why did direct marketing become advertising's down market cousin?

A. Mass production becomes more popular.
B. It began to be looked down upon
C. Large quantities could be sold through mass advertising
D. It became less fashionable because of chain stores

cat1997 english-language passage-reading

## 5.2.124 English Language: CAT 1997 | Question: 74 top

**Read the passages given below carefully and answer the questions that follow:**

The new form of direct marketing is a big step up from today's crude version. But it is also in some ways a step backwards. The first direct marketers were trusted, local shopkeepers. Compared with today's direct marketers, whose best stab at intimacy is a pre-printed letter with a misspelt name, the local shopkeeper really knew his customers – remembering when to order a favourite bolt of fabric for one, suggesting a new cough tincture to another. "He carried his database in his head", says Don Peppers, who with Martha Rogers was an early advocate of personalised marketing.

The transformation of direct marketing from its local origins into advertising's downmarket cousin dates from the birth of mass

production, which enabled manufacturers to produce goods in large quantities for sale by chain stores to unseen buyers. The first mass produced shoes in America were called “straights”, with identical shapes for left and right feet. Lester Wunderman, inventor of the term “direct marketing”, believes that mass production has conditioned consumers to expect unsatisfactory service and goods. “It created a culture of things that didn’t quite fit, didn’t quite suit and didn’t quite serve”, he says.

With mass retailing came mass advertising. Without direct contact with the consumer, manufacturers could not know who was buying what; only what was selling. Mass advertising established a link between a product and millions of faceless consumers. Brands – encapsulating a short, memorable message – were part of this relationship. The result has in many cases been fantastically successful: Coca-Cola has created an image that is instantly recognised and even has emotional resonance.

Yet branding is, at best, an imprecise art. Most consumers would be hard-pressed to explain why, say, Levis or Nike are losing cachet to such newcomers as Tommy Hilfiger. Because they sell through huge retailers, producers struggle to know why customers buy their brands. As advertising costs have risen and the media have fragmented, mass marketing has become harder and more costly. That, plus new computer technology has pushed direct marketing into the limelight. Its full potential is only just being grasped. By manipulating information, including data over the Internet, direct marketing can be targeted and personalised. It can even be intelligent–learning what customers like from what they buy and where they browse, as well as soliciting feedback via the telephone and e-mail. The result can be more effective than mass advertising.

The low costs of direct marketing have created a huge and fast-growing industry–made up of direct mail, telemarketing, database marketing, the Internet and free phone TV, radio and print advertisements. In its biggest market, North America, the industry was worth $′163 billion in 1998, when it grew by 7% to almost three-fifths of the country’s total spending on advertising. The industry expects 7% annual growth to 2002, beating the 5.5% forecast for advertising spending

Direct marketing is growing even faster in places where junk mail is new enough still to be welcome. Robert Wientzen, president of America’s Direct Marketing Association, says that in Russian and the Czech Republic most junk mail is opened and read – indeed the average piece is pored over by more than one person. Even in China, despite an unreliable postal service and few credit cards, the government in encouraging direct marketing, partly to stop people migrating to cities in search of things to buy.

Yet most direct marketing remains clumsy. Britain’s Direct Marketing Association admits its members spend $30, 000 (dollar 49, 000) a year sending mailings to dead people. Typical success rates for most mailshot campaigns in mature countries are no better than 2%. Steve Dapper, chief executive of Rupp Collins, a big direct marketing agency, complaints that consumer data are sold too freely, leading to pesky cold calls and junk mail. The trouble is that direct marketing is still driven by the same thinking as mass marketing.

Most direct marketing is based on profiles built by classification systems that use a mixture of census data, questionnaires, and electoral roll information and, in America, credit- card data to segment populations. This information is passed to a direct marketing agency to slice into profiles. Having defined a type, the agency buys the names and addresses of similar people from mailing lists sold by list brokers. The profiles are not sophisticated. **Read the passages given below carefully and answer the questions that follow:**

The new form of direct marketing is a big step up from today's crude version. But it is also in some ways a step backwards. The first direct marketers were trusted, local shopkeepers. Compared with today's direct marketers, whose best stab at intimacy is a pre-printed letter with a misspelt name, the local shopkeeper really knew his customers – remembering when to order a favourite bolt of fabric for one, suggesting a new cough tincture to another. "He carried his database in his head", says Don Peppers, who with Martha Rogers was an early advocate of personalised marketing.

The transformation of direct marketing from its local origins into advertising's downmarket cousin dates from the birth of mass production, which enabled manufacturers to produce goods in large quantities for sale by chain stores to unseen buyers. The first mass produced shoes in America were called "straights", with identical shapes for left and right feet. Lester Wunderman, inventor of the term "direct marketing", believes that mass production has conditioned consumers to expect unsatisfactory service and goods. "It created a culture of things that didn't quite fit, didn't quite suit and didn't quite serve", he says.

With mass retailing came mass advertising. Without direct contact with the consumer, manufacturers could not know who was buying what; only what was selling. Mass advertising established a link between a product and millions of faceless consumers. Brands – encapsulating a short, memorable message – were part of this relationship. The result has in many cases been fantastically successful: Coca-Cola has created an image that is instantly recognised and even has emotional resonance.

Yet branding is, at best, an imprecise art. Most consumers would be hard-pressed to explain why, say, Levis or Nike are losing cachet to such newcomers as Tommy Hilfiger. Because they sell through huge retailers, producers struggle to know why customers buy their brands. As advertising costs have risen and the media have fragmented, mass marketing has become harder and more costly. That, plus new computer technology has pushed direct marketing into the limelight. Its full potential is only just being grasped. By manipulating information, including data over the Internet, direct marketing can be targeted and personalised. It can even be intelligent–learning what customers like from what they buy and where they browse, as well as soliciting feedback via the telephone and e-mail. The result can be more effective than mass advertising.

The low costs of direct marketing have created a huge and fast-growing industry–made up of direct mail, telemarketing, database marketing, the Internet and free phone TV, radio and print advertisements. In its biggest market, North America, the industry was worth $ ′163 billion in 1998, when it grew by 7% to almost three-fifths of the country's total spending on advertising. The industry expects 7% annual growth to 2002, beating the 5.5% forecast for advertising spending

Direct marketing is growing even faster in places where junk mail is new enough still to be welcome. Robert Wientzen, president of America's Direct Marketing Association, says that in Russian and the Czech Republic most junk mail is opened

and read – indeed the average piece is pored over by more than one person. Even in China, despite an unreliable postal service and few credit cards, the government in encouraging direct marketing, partly to stop people migrating to cities in search of things to buy.

Yet most direct marketing remains clumsy. Britain's Direct Marketing Association admits its members spend $30,000 (dollar 49,000) a year sending mailings to dead people. Typical success rates for most mailshot campaigns in mature countries are no better than 2%. Steve Dapper, chief executive of Rupp Collins, a big direct marketing agency, complaints that consumer data are sold too freely, leading to pesky cold calls and junk mail. The trouble is that direct marketing is still driven by the same thinking as mass marketing.

Most direct marketing is based on profiles built by classification systems that use a mixture of census data, questionnaires, and electoral roll information and, in America, credit- card data to segment populations. This information is passed to a direct marketing agency to slice into profiles. Having defined a type, the agency buys the names and addresses of similar people from mailing lists sold by list brokers. The profiles are not sophisticated. Scott Adms, creator of the Dibert cartoons, jokes that the most important category is "the Stupid Rich", so named because of their tendency to buy anything that's new, regardless of cost or usefulness. If you sell enough to them, he says, you can afford to sell the rest to "The Stupid Poor".

Which of the following factors have been identified as contributing to the popularity of direct marketing?

I. Its low costs
II. High cost of advertising
III. Fragmentation of the media

A. I and II B. I and III C. II and III D. I, II and III

**Read the passages given below carefully and answer the questions that follow:**

The new form of direct marketing is a big step up from today's crude version. But it is also in some ways a step backwards. The first direct marketers were trusted, local shopkeepers. Compared with today's direct marketers, whose best stab at intimacy is a pre-printed letter with a misspelt name, the local shopkeeper really knew his customers – remembering when to order a favourite bolt of fabric for one, suggesting a new cough tincture to another. "He carried his database in his head", says Don Peppers, who with Martha Rogers was an early advocate of personalised marketing.

The transformation of direct marketing from its local origins into advertising's downmarket cousin dates from the birth of mass production, which enabled manufacturers to produce goods in large quantities for sale by chain stores to unseen buyers. The first mass produced shoes in America were called "straights", with identical shapes for left and right feet. Lester Wunderman, inventor of the term "direct marketing", believes that mass production has conditioned consumers to expect unsatisfactory service and goods. "It created a culture of things that didn't quite fit, didn't quite suit and didn't quite serve", he says.

With mass retailing came mass advertising. Without direct contact with the consumer, manufacturers could not know who was buying what; only what was selling. Mass advertising established a link between a product and millions of faceless consumers. Brands – encapsulating a short, memorable message – were part of this relationship. The result has in many cases been fantastically successful: Coca-Cola has created an image that is instantly recognised and even has emotional resonance.

Steve Dapper, chief executive of Rupp Collins, a big direct marketing agency, complaints that consumer data are sold too freely, leading to pesky cold calls and junk mail. The trouble is that direct marketing is still driven by the same thinking as mass marketing.

Most direct marketing is based on profiles built by classification systems that use a mixture of census data, questionnaires, and electoral roll information and, in America, credit- card data to segment populations. This information is passed to a direct marketing agency to slice into profiles. Having defined a type, the agency buys the names and addresses of similar people from mailing lists sold by list brokers. The profiles are not sophisticated. Scott Adms, creator of the Dibert cartoons, jokes that the most important category is "the Stupid Rich", so named because of their tendency to buy anything that's new, regardless of cost or usefulness. If you sell enough to them, he says, you can afford to sell the rest to "The Stupid Poor".

The author feels that it is important to sell to "The Stupid Rich" because:

A. They will buy anything new, contributing to profits
B. You can then afford to sell the rest to "The Stupid Poor"
C. It is easier to sell to "The Stupid Poor"
D. None of the above.

cat1997 english-language passage-reading

## 5.2.131 English Language: CAT 1997 | Question: 81 top

**Read the passages given below carefully and answer the questions that follow:**

Of the greatest leaders, it is said by his followers, long after he has gone, he made us do it. If leadership is the art of persuading your people to follow your bidding, without their realising your involvement, the archetype of its practice is N. R. Narayana Murthy, the chairman and managing director of the Rs 143.81 crore Infosys Technologies (Infosys). For, the 52-year-old CEO of the globalised software corporation – which he founded with seven friends, and a combined capital of Rs. 10, 000 in 1981, and which now occupies the front ranks of the country's most admired corporations – leads with the subtlest of weapons: personal example.

Infosys ranks only 578th among the country's listed companies, and sixth in the software sector, in terms of its turnover. But it is setting new standards for India Inc. through its practice of inter alia awarding stock options to its employees, putting the value of its intellectual assets and its brands on its balance-sheet, and conforming to the disclosure standards of the Securities and Exchange Commission (SEC) of the US. Behind all this is the stubborn personal subscription of its CEO to the underlying causes of wealth-creation, people-power and transparency. "What were choices earlier are compulsions now," asserts Murthy.

In fact, the mirror images of Murthy, the man, can be found all over Infosys. His Company. His egalitarianism – which finds expression in such habits as using the 'same table and chair as anyone else in the organisation – is practised firmly when it comes to charting a course for the company's future: everyone has a voice. "We have no hierarchy just for the sake of control."

Brimming with the conviction that customer satisfaction is the key to success, Murthy has built a fleet-footed human resource management system that treats employees as customers, using the resources of the organisation to meet their professional and personal needs. His instruments are not just top-of-the markets salaries, but also operational empowerment as well as every facility that an employee needs to focus on the job.

Just what methods does Murthy use to ensure that his DNA is replicated in his company? Not for him are the classical leadership genres – transactional or transformational, situational or visionary. His chosen style, instead, is to lead by example, ensuring that the CEO's actions set the template for all Info scions.

Murthy believes that the betterment of man can be brought about through the "creation of wealth, legally and ethically". The personal example that he has set enabled his company to mirror those beliefs: tying his own rewards, and measuring his value to the company, to his ability to create wealth, and erecting systems for the company's wealth to be shared by its people. Sums up Nandan Nilekani, 41, deputy managing director, Infosys: "This is the future model of the corporation. Run an excellent company, and let the market increase its value to create wealth."

Although Murthy is one of the prime beneficiaries of the philosophy – his 10 per cent stake in Infosys is worth Rs. 130 crore today – in his book, the leader leads not by grabbing the- booty- but by teaching others to take what they deserve.

That's why, on the Infosys' balance-sheet, the value of Murthy's intellectual capital is nowhere near the top, on the rationale, that the CEO, at 52, is worth far less to his company than, say, a bright young programmer of 26. To spread the company's wealth, Murthy has instituted stock options the first to do so in the country – for employees, creating 300 millionaires and growing to 1000 by 2000.

To act as a beacon for his version of the learning organization, Murthy not only spends an hour a day trawling the Internet to learn about new technological developments in his field, he also makes as many luncheon appointments as he can with technical people and academicians – dons from the Indian Institutes of Technology for instance – systematically plumbing their depths for an understanding of new developments in InfoTech. Murthy's objective is not just to stay abreast of the state of the art, but also to find a way to use that knowledge for the company.

Following Murthy's example, Infosys has set up a technology advancement unit, whose mandate is to track, evaluate, and assimilate new techniques and methodologies. In fact, Murthy views learning not just as amassing data, but as a process that enables him to use the lessons from failure to achieve success. This self-corrective loop is what he demonstrates through his leadership during a crisis.

In 1995, for example, Infosys lost a Rs. 15-crore account – then 20 percent of its revenues – when the 69 billion GE yanked its business from it. Instead of recriminations, Murthy activated Infosys' machinery to understand why the business was taken away, and to leverage the learning for getting new clients instead. Feeling determined instead of guilty, his employees went on to sign up high profile customers like the Dollar 20 billion Xerox, the Dollar 7 billion Levi Strauss, and the Dollar 14 billion Nynex.

"You must have a multi-dimensional view of paradigms," says the multi-tasking leader. The objective is obvious: ensure that Infosys' perspective on its business and the world comes from as many vantage points as possible so that corporate strategy can be synthesised not from a narrow vision, but from a wide angle lens. In fact, Murthy still regrets that, in its initial years, infosys didn't distill a multi-pronged understanding of the environment into its strategies, which forced it on to an incremental path that led revenues to snake up from Rs. 0.02 crore to just Rs. 5 crore in the first 10 years.

It was after looking around itself instead of focusing on its initial business of banking software, that Infosys managed to accelerate. Today the company operates with stretch targets, setting distant goals and working backwards to get to them. The crucial pillar on which Murthy bases his ethical leadership is openness. Transparency, he reckons, is the clearest signal that one has nothing to hide. The personal manifestations of that are inter alia the practice of always giving complete information whenever any employee, customer, or investor asks for it: the loudly proclaimed insistence that every Info scion pay taxes and file returns; and a perpetually open office into which anyone can walk into.

But even as he tries to lead Infosys into cloning is own approach to enterprise, is Murthy choosing the best future for it? If

Infosys grows with the same lack of ambition, the same softness of style, and the same absence of aggression, is it not cutting off avenues of growth that others may seize? As Infosys approaches the 21st century, it is obvious that Murthy's leadership will have to set ever-improving role models for his ever-learning company. After all, men grow old: companies shouldn't.

One of the ways in which Infosys spreads the company's wealth among its employees is:

A. By awarding stock options.
B. By giving extravagant bonus at the end of each year.
C. Both a) and b) above.
D. None of the above.

Just what methods does Murthy use to ensure that his DNA is replicated in his company? Not for him are the classical leadership genres – transactional or transformational, situational or visionary. His chosen style, instead, is to lead by example, ensuring that the CEO's actions set the template for all Info scions.

Murthy believes that the betterment of man can be brought about through the "creation of wealth, legally and ethically". The personal example that he has set enabled his company to mirror those beliefs: tying his own rewards, and measuring his value to the company, to his ability to create wealth, and erecting systems for the company's wealth to be shared by its people. Sums up Nandan Nilekani, 41, deputy managing director, Infosys: "This is the future model of the corporation. Run an excellent company, and let the market increase its value to create wealth."

Although Murthy is one of the prime beneficiaries of the philosophy – his 10 per cent stake in Infosys is worth Rs. 130 crore today – in his book, the leader leads not by grabbing the- booty- but by teaching others to take what they deserve.

That's why, on the Infosys' balance-sheet, the value of Murthy's intellectual capital is nowhere near the top, on the rationale, that the CEO, at 52, is worth far less to his company than, say, a bright young programmer of 26. To spread the company's wealth, Murthy has instituted stock options the first to do so in the country – for employees, creating 300 millionaires and growing to 1000 by 2000.

To act as a beacon for his version of the learning organization, Murthy not only spends an hour a day trawling the Internet to learn about new technological developments in his field, he also makes as many luncheon appointments as he can with technical people and academicians – dons from the Indian Institutes of Technology for instance – systematically plumbing their depths for an understanding of new developments in InfoTech. Murthy's objective is not just to stay abreast of the state of

the art, but also to find a way to use that knowledge for the company.

Following Murthy's example, Infosys has set up a technology advancement unit, whose mandate is to track, evaluate, and assimilate new techniques and methodologies. In fact, Murthy views learning not just as amassing data, but as a process that enables him to use the lessons from failure to achieve success. This self-corrective loop is what he demonstrates through his leadership during a crisis.

In 1995, for example, Infosys lost a Rs. 15-crore account – then 20 percent of its revenues – when the 69 billion GE yanked its business from it. Instead of recriminations, Murthy activated Infosys' machinery to understand why the business was taken away, and to leverage the learning for getting new clients instead. Feeling determined instead of guilty, his employees went on to sign up high profile customers like the Dollar 20 billion Xerox, the Dollar 7 billion Levi Strauss, and the Dollar 14 billion Nynex.

"You must have a multi-dimensional view of paradigms," says the multi-tasking leader. The objective is obvious: ensure that Infosys' perspective on its business and the world comes from as many vantage points as possible so that corporate strategy can be synthesised not from a narrow vision, but from a wide angle lens. In fact, Murthy still regrets that, in its initial years, infosys didn't distill a multi-pronged understanding of the environment into its strategies, which forced it on to an incremental path that led revenues to snake up from Rs. 0.02 crore to just Rs. 5 crore in the first 10 years.

It was after looking around itself instead of focusing on its initial business of banking software, that Infosys managed to accelerate. Today the company operates with stretch targets, setting distant goals and working backwards to get to them. The crucial pillar on which Murthy bases his ethical leadership is openness. Transparency, he reckons, is the clearest signal that one has nothing to hide. The personal manifestations of that are inter alia the practice of always giving complete information whenever any employee, customer, or investor asks for it: the loudly proclaimed insistence that every Info scion pay taxes and file returns; and a perpetually open office into which anyone can walk into.

But even as he tries to lead Infosys into cloning is own approach to enterprise, is Murthy choosing the best future for it? If Infosys grows with the same lack of ambition, the same softness of style, and the same absence of aggression, is it not cutting off avenues of growth that others may seize? As Infosys approaches the 21st century, it is obvious that Murthy's leadership will have to set ever-improving role models for his ever-learning company. After all, men grow old: companies shouldn't.

We can say that Murthy believes in:

A. Betterment of man through learning.

B. Betterment of man through ethical creation of wealth.

C. Betterment of man through experimentation.

D. All of the above

**Read the passages given below carefully and answer the questions that follow:**

leadership is the art of persuading your people to follow your bidding, without their realising your involvement, the archetype of its practice is N. R. Narayana Murthy, the chairman and managing director of the Rs 143.81 crore Infosys Technologies (Infosys). For, the 52-year-old CEO of the globalised software corporation – which he founded with seven friends, and a combined capital of Rs. 10, 000 in 1981, and which now occupies the front ranks of the country's most admired corporations – leads with the subtlest of weapons: personal example.

Infosys ranks only 578th among the country's listed companies, and sixth in the software sector, in terms of its turnover. But it is setting new standards for India Inc. through its practice of inter alia awarding stock options to its employees, putting the value of its intellectual assets and its brands on its balance-sheet, and conforming to the disclosure standards of the Securities and Exchange Commission (SEC) of the US. Behind all this is the stubborn personal subscription of its CEO to the underlying causes of wealth-creation, people-power and transparency. "What were choices earlier are compulsions now," asserts Murthy.

In fact, the mirror images of Murthy, the man, can be found all over Infosys. His Company. His egalitarianism – which finds expression in such habits as using the 'same table and chair as anyone else in the organisation – is practised firmly when it comes to charting a course for the company's future: everyone has a voice. "We have no hierarchy just for the sake of control."

Brimming with the conviction that customer satisfaction is the key to success, Murthy has built a fleet-footed human resource management system that treats employees as customers, using the resources of the organisation to meet their professional and personal needs. His instruments are not just top-of-the markets salaries, but also operational empowerment as well as every facility that an employee needs to focus on the job.

Just what methods does Murthy use to ensure that his DNA is replicated in his company? Not for him are the classical leadership genres – transactional or transformational, situational or visionary. His chosen style, instead, is to lead by example, ensuring that the CEO's actions set the template for all Info scions.

Murthy believes that the betterment of man can be brought about through the "creation of wealth, legally and ethically". The personal example that he has set enabled his company to mirror those beliefs: tying his own rewards, and measuring his value to the company, to his ability to create wealth, and erecting systems for the company's wealth to be shared by its people. Sums up Nandan Nilekani, 41, deputy managing director, Infosys: "This is the future model of the corporation. Run an

excellent company, and let the market increase its value to create wealth."

Although Murthy is one of the prime beneficiaries of the philosophy – his 10 per cent stake in Infosys is worth Rs. 130 crore today – in his book, the leader leads not by grabbing the- booty- but by teaching others to take what they deserve.

That's why, on the Infosys' balance-sheet, the value of Murthy's intellectual capital is nowhere near the top, on the rationale, that the CEO, at 52, is worth far less to his company than, say, a bright young programmer of 26. To spread the company's wealth, Murthy has instituted stock options the first to do so in the country – for employees, creating 300 millionaires and growing to 1000 by 2000.

To act as a beacon for his version of the learning organization, Murthy not only spends an hour a day trawling the Internet to learn about new technological developments in his field, he also makes as many luncheon appointments as he can with technical people and academicians – dons from the Indian Institutes of Technology for instance – systematically plumbing their depths for an understanding of new developments in InfoTech. Murthy's objective is not just to stay abreast of the state of the art, but also to find a way to use that knowledge for the company.

Following Murthy's example, Infosys has set up a technology advancement unit, whose mandate is to track, evaluate, and assimilate new techniques and methodologies. In fact, Murthy views learning not just as amassing data, but as a process that enables him to use the lessons from failure to achieve success. This self-corrective loop is what he demonstrates through his leadership during a crisis.

In 1995, for example, Infosys lost a Rs. 15-crore account – then 20 percent of its revenues – when the 69 billion GE yanked its business from it. Instead of recriminations, Murthy activated Infosys' machinery to understand why the business was taken away, and to leverage the learning for getting new clients instead. Feeling determined instead of guilty, his employees went on to sign up high profile customers like the Dollar 20 billion Xerox, the Dollar 7 billion Levi Strauss, and the Dollar 14 billion Nynex.

"You must have a multi-dimensional view of paradigms," says the multi-tasking leader. The objective is obvious: ensure that Infosys' perspective on its business and the world comes from as many vantage points as possible so that corporate strategy can be synthesised not from a narrow vision, but from a wide angle lens. In fact, Murthy still regrets that, in its initial years, infosys didn't distill a multi-pronged understanding of the environment into its strategies, which forced it on to an incremental path that led revenues to snake up from Rs. 0.02 crore to just Rs. 5 crore in the first 10 years.

It was after looking around itself instead of focusing on its initial business of banking software, that Infosys managed to accelerate. Today the company operates with stretch targets, setting distant goals and working backwards to get to them. The crucial pillar on which Murthy bases his ethical leadership is openness. Transparency, he reckons, is the clearest signal that one has nothing to hide. The personal manifestations of that are inter alia the practice of always giving complete information whenever any employee, customer, or investor asks for it: the loudly proclaimed insistence that every Info scion pay taxes and file returns; and a perpetually open office into which anyone can walk into.

But even as he tries to lead Infosys into cloning is own approach to enterprise, is Murthy choosing the best future for it? If Infosys grows with the same lack of ambition, the same softness of style, and the same absence of aggression, is it not cutting off avenues of growth that others may seize? As Infosys approaches the 21st century, it is obvious that Murthy's leadership will have to set ever-improving role models for his ever-learning company. After all, men grow old: companies shouldn't.

The example of the Rs. 15-crore account highlights:

A. Murthy's ability to see his company through a crisis.
B. Murthy's ability to turn failure into success.
C. Murthy's potential to handle a crisis.
D. All of the above.

His egalitarianism – which finds expression in such habits as using the 'same table and chair as anyone else in the organisation – is practised firmly when it comes to charting a course for the company's future: everyone has a voice. "We have no hierarchy just for the sake of control."

Brimming with the conviction that customer satisfaction is the key to success, Murthy has built a fleet-footed human resource management system that treats employees as customers, using the resources of the organisation to meet their professional and personal needs. His instruments are not just top-of-the markets salaries, but also operational empowerment as well as every facility that an employee needs to focus on the job.

Just what methods does Murthy use to ensure that his DNA is replicated in his company? Not for him are the classical leadership genres – transactional or transformational, situational or visionary. His chosen style, instead, is to lead by example, ensuring that the CEO's actions set the template for all Info scions.

Murthy believes that the betterment of man can be brought about through the "creation of wealth, legally and ethically". The personal example that he has set enabled his company to mirror those beliefs: tying his own rewards, and measuring his value to the company, to his ability to create wealth, and erecting systems for the company's wealth to be shared by its people. Sums up Nandan Nilekani, 41, deputy managing director, Infosys: "This is the future model of the corporation. Run an excellent company, and let the market increase its value to create wealth."

Although Murthy is one of the prime beneficiaries of the philosophy – his 10 per cent stake in Infosys is worth Rs. 130 crore today – in his book, the leader leads not by grabbing the- booty- but by teaching others to take what they deserve.

That's why, on the Infosys' balance-sheet, the value of Murthy's intellectual capital is nowhere near the top, on the rationale, that the CEO, at 52, is worth far less to his company than, say, a bright young programmer of 26. To spread the company's wealth, Murthy has instituted stock options the first to do so in the country – for employees, creating 300 millionaires and growing to 1000 by 2000.

To act as a beacon for his version of the learning organization, Murthy not only spends an hour a day trawling the Internet to learn about new technological developments in his field, he also makes as many luncheon appointments as he can with technical people and academicians – dons from the Indian Institutes of Technology for instance – systematically plumbing their depths for an understanding of new developments in InfoTech. Murthy's objective is not just to stay abreast of the state of the art, but also to find a way to use that knowledge for the company.

Following Murthy's example, Infosys has set up a technology advancement unit, whose mandate is to track, evaluate, and assimilate new techniques and methodologies. In fact, Murthy views learning not just as amassing data, but as a process that enables him to use the lessons from failure to achieve success. This self-corrective loop is what he demonstrates through his leadership during a crisis.

In 1995, for example, Infosys lost a Rs. 15-crore account – then 20 percent of its revenues – when the 69 billion GE yanked its

business from it. Instead of recriminations, Murthy activated Infosys' machinery to understand why the business was taken away, and to leverage the learning for getting new clients instead. Feeling determined instead of guilty, his employees went on to sign up high profile customers like the Dollar 20 billion Xerox, the Dollar 7 billion Levi Strauss, and the Dollar 14 billion Nynex.

"You must have a multi-dimensional view of paradigms," says the multi-tasking leader. The objective is obvious: ensure that Infosys' perspective on its business and the world comes from as many vantage points as possible so that corporate strategy can be synthesised not from a narrow vision, but from a wide angle lens. In fact, Murthy still regrets that, in its initial years, infosys didn't distill a multi-pronged understanding of the environment into its strategies, which forced it on to an incremental path that led revenues to snake up from Rs. 0.02 crore to just Rs. 5 crore in the first 10 years.

It was after looking around itself instead of focusing on its initial business of banking software, that Infosys managed to accelerate. Today the company operates with stretch targets, setting distant goals and working backwards to get to them. The crucial pillar on which Murthy bases his ethical leadership is openness. Transparency, he reckons, is the clearest signal that one has nothing to hide. The personal manifestations of that are inter alia the practice of always giving complete information whenever any employee, customer, or investor asks for it: the loudly proclaimed insistence that every Info scion pay taxes and file returns; and a perpetually open office into which anyone can walk into.

But even as he tries to lead Infosys into cloning is own approach to enterprise, is Murthy choosing the best future for it? If Infosys grows with the same lack of ambition, the same softness of style, and the same absence of aggression, is it not cutting off avenues of growth that others may seize? As Infosys approaches the 21st century, it is obvious that Murthy's leadership will have to set ever-improving role models for his ever-learning company. After all, men grow old: companies shouldn't.

It is evident from the passage that:

A. Infosys will have to devise new strategies to meet the challenges of the 21st century.
B. Infosys will stagnate if it does not become aggressive.
C. Infosys may have to become more aggressive in order to retain its market.
D. None of the above.

## 5.2.139 English Language: CAT 1997 | Question: 89 top

Read the passages given below carefully and answer the questions that follow.

leadership is the art of persuading your people to follow your bidding, without their realising your involvement, the archetype of its practice is N. R. Narayana Murthy, the chairman and managing director of the Rs 143.81 crore Infosys Technologies (Infosys). For, the 52-year-old CEO of the globalised software corporation – which he founded with seven friends, and a combined capital of Rs. 10, 000 in 1981, and which now occupies the front ranks of the country's most admired corporations – leads with the subtlest of weapons: personal example.

Infosys ranks only 578th among the country's listed companies, and sixth in the software sector, in terms of its turnover. But it is setting new standards for India Inc. through its practice of inter alia awarding stock options to its employees, putting the value of its intellectual assets and its brands on its balance-sheet, and conforming to the disclosure standards of the Securities and Exchange Commission (SEC) of the US. Behind all this is the stubborn personal subscription of its CEO to the underlying causes of wealth-creation, people-power and transparency. "What were choices earlier are compulsions now," asserts Murthy.

In fact, the mirror images of Murthy, the man, can be found all over Infosys. His Company. His egalitarianism – which finds expression in such habits as using the 'same table and chair as anyone else in the organisation – is practised firmly when it comes to charting a course for the company's future: everyone has a voice. "We have no hierarchy just for the sake of control."

Brimming with the conviction that customer satisfaction is the key to success, Murthy has built a fleet-footed human resource management system that treats employees as customers, using the resources of the organisation to meet their professional and personal needs. His instruments are not just top-of-the markets salaries, but also operational empowerment as well as every facility that an employee needs to focus on the job.

Just what methods does Murthy use to ensure that his DNA is replicated in his company? Not for him are the classical leadership genres – transactional or transformational, situational or visionary. His chosen style, instead, is to lead by example, ensuring that the CEO's actions set the template for all Info scions.

Murthy believes that the betterment of man can be brought about through the "creation of wealth, legally and ethically". The personal example that he has set enabled his company to mirror those beliefs: tying his own rewards, and measuring his value to the company, to his ability to create wealth, and erecting systems for the company's wealth to be shared by its people. Sums up Nandan Nilekani, 41, deputy managing director, Infosys: "This is the future model of the corporation. Run an excellent company, and let the market increase its value to create wealth."

Although Murthy is one of the prime beneficiaries of the philosophy – his 10 per cent stake in Infosys is worth Rs. 130 crore today – in his book, the leader leads not by grabbing the- booty- but by teaching others to take what they deserve.

That's why, on the Infosys' balance-sheet, the value of Murthy's intellectual capital is nowhere near the top, on the rationale, that the CEO, at 52, is worth far less to his company than, say, a bright young programmer of 26. To spread the company's

wealth, Murthy has instituted stock options the first to do so in the country – for employees, creating 300 millionaires and growing to 1000 by 2000.

To act as a beacon for his version of the learning organization, Murthy not only spends an hour a day trawling the Internet to learn about new technological developments in his field, he also makes as many luncheon appointments as he can with technical people and academicians – dons from the Indian Institutes of Technology for instance – systematically plumbing their depths for an understanding of new developments in InfoTech. According to the passage:

A. Infosys is a reflection of its CEO.
B. Infosys brings the best out in Murthy.
C. Infosys and Murthy are synonymous.
D. Murthy the man and Murthy the CEO are incompatible.

cat1997 english-language passage-reading

## 5.2.141 English Language: CAT 1997 | Question: 91 top

**Read the passages given below carefully and answer the questions that follow:**

Water plays a versatile role in the functioning of the biosphere. The water cycle has two distinct branches – the atmospheric branch and the terrestrial branch. In the atmosphere, water exists mainly in gaseous form. On the earth, liquid forms and solid forms (ice/snow) predominate.

Water is important to the biosphere in that it is from water that the biosphere draws its most, abundant element, hydrogen. Hydrogen in the form of carbohydrates constitutes a very important source of energy for all living things. Although we have a plentiful supply of water in the oceans, it is not of direct use to use. We have to depend upon a small stock of water - less than 1% - contained in our rivers and fresh water lakes and in the subsoil. Even this small proportion can cause havoc to life if it is not properly managed: the reference here is to floods.

While relief measures are undoubtedly important, attention has to be focused on long-term flood control measures. In the past, we had constructed flood moderation reservoirs across catchment's areas of rivers, and built 19, 260 km of embankments and

27, 850 km length of drainage channels. Besides 18, 900 villages have been raised above the flood level up to March 1997.

The fact is that long-term flood control measures, to be effective, should include both traditional methods and a forestation measures. The intensity of floods may be reduced by keeping the drainage channels clear and removing the accumulated silt from reservoirs and riverbeds. In fact, the dams built have trapped silt coming from the hills and prevented its large accumulation in riverbeds downstream. Hence the new emphasis on building more dams in the northern rivers should be welcomed. The embankments also need to be reinforced. In many places, they are just made of mud and sand and easily breached by a little gush of water. Other improvements should be in the regulation of water discharge from filled reservoirs and in the flood forecasting system. Even the present warning system, though inadequate, has helped to save many valuable lives and property. Since the states have been lethargic in implementing flood control schemes and since most rivers flow through many states, it would be better if flood control is handled by the Centre. The mighty Himalayan rivers are unlikely to be tamed unless we have a basic understanding as to how floods originate. Since 1947, Indian and foreign scientists have been repeatedly emphasizing that the volume of water in the Himalayan rivers in the monsoons is the combined effect of rainfall, snow melt and glacier discharges. Even the first expert committed set up by Nehru had opined that a serious study of the snow melt and glacier discharges is essential for avoiding flood disasters in the north. But efforts in this direction during the last 50 years have been very inadequate. Now that satellite pictures are available detailing the snow-cover in the Himalayas over large areas it would do well to initiate measures to obtain the relevant data from such pictures. Field studies in the Himalayan region would also help flood control measures.

Which of the following, according to the passage, is a new non-traditional method of flood control?

A. Construction of flood moderation reservoirs across catchment areas of rivers.
B. Building embankments
C. Laying drainage channels
D. Planting more area with trees

cat1997 english-language passage-reading

## 5.2.142 English Language: CAT 1997 | Question: 92 top

**Read the passages given below carefully and answer the questions that follow:**

Water plays a versatile role in the functioning of the biosphere. The water cycle has two distinct branches – the atmospheric branch and the terrestrial branch. In the atmosphere, water exists mainly in gaseous form. On the earth, liquid forms and solid forms (ice/snow) predominate.

Water is important to the biosphere in that it is from water that the biosphere draws its most, abundant element, hydrogen. Hydrogen in the form of carbohydrates constitutes a very important source of energy for all living things. Although we have a plentiful supply of water in the oceans, it is not of direct use to use. We have to depend upon a small stock of water - less than 1% - contained in our rivers and fresh water lakes and in the subsoil. Even this small proportion can cause havoc to life if it is not properly managed: the reference here is to floods.

While relief measures are undoubtedly important, attention has to be focused on long-term flood control measures. In the past, we had constructed flood moderation reservoirs across catchment's areas of rivers, and built 19, 260 km of embankments and 27, 850 km length of drainage channels. Besides 18, 900 villages have been raised above the flood level up to March 1997.

The fact is that long-term flood control measures, to be effective, should include both traditional methods and a forestation measures. The intensity of floods may be reduced by keeping the drainage channels clear and removing the accumulated silt from reservoirs and riverbeds. In fact, the dams built have trapped silt coming from the hills and prevented its large accumulation in riverbeds downstream. Hence the new emphasis on building more dams in the northern rivers should be welcomed. The embankments also need to be reinforced. In many places, they are just made of mud and sand and easily breached by a little gush of water. Other improvements should be in the regulation of water discharge from filled reservoirs and in the flood forecasting system. Even the present warning system, though inadequate, has helped to save many valuable lives and property. Since the states have been lethargic in implementing flood control schemes and since most rivers flow through many states, it would be better if flood control is handled by the Centre. The mighty Himalayan rivers are unlikely to be tamed unless we have a basic understanding as to how floods originate. Since 1947, Indian and foreign scientists have been repeatedly emphasizing that the volume of water in the Himalayan rivers in the monsoons is the combined effect of rainfall, snow melt and glacier discharges. Even the first expert committed set up by Nehru had opined that a serious study of the snow melt and glacier discharges is essential for avoiding flood disasters in the north. But efforts in this direction during the last $50 years have been very inadequate. Now that satellite pictures are available detailing the snow-cover in the Himalayas over large areas it would do well to initiate measures to obtain the relevant data from such pictures. Field studies in the Himalayan region would also help flood control measures.

The author speaks approvingly of all of the following except:

A. Afforestation measures
B. The last five decades' efforts at studying the Himalayan environment.
C. Emphasis On Building Dams
D. Inadequate flood warning system

cat1997 english-language passage-reading

## 5.2.143 English Language: CAT 1997 | Question: 93 top

**Read the passages given below carefully and answer the questions that follow:**

Water plays a versatile role in the functioning of the biosphere. The water cycle has two distinct branches – the atmospheric branch and the terrestrial branch. In the atmosphere, water exists mainly in gaseous form. On the earth, liquid forms and solid forms (ice/snow) predominate.

Water is important to the biosphere in that it is from water that the biosphere draws its most, abundant element, hydrogen. Hydrogen in the form of carbohydrates constitutes a very important source of energy for all living things. Although we have a plentiful supply of water in the oceans, it is not of direct use to use. We have to depend upon a small stock of water - less than 1% - contained in our rivers and fresh water lakes and in the subsoil. Even this small proportion can cause havoc to life if it is not properly managed: the reference here is to floods.

While relief measures are undoubtedly important, attention has to be focused on long-term flood control measures. In the past, we had constructed flood moderation reservoirs across catchment's areas of rivers, and built 19, 260 km of embankments and 27, 850 km length of drainage channels. Besides 18, 900 villages have been raised above the flood level up to March 1997.

The fact is that long-term flood control measures, to be effective, should include both traditional methods and a forestation measures. The intensity of floods may be reduced by keeping the drainage channels clear and removing the accumulated silt from reservoirs and riverbeds. In fact, the dams built have trapped silt coming from the hills and prevented its large accumulation in riverbeds downstream. Hence the new emphasis on building more dams in the northern rivers should be welcomed. The embankments also need to be reinforced. In many places, they are just made of mud and sand and easily breached by a little gush of water. Other improvements should be in the regulation of water discharge from filled reservoirs and in the flood forecasting system. Even the present warning system, though inadequate, has helped to save many valuable lives and property. Since the states have been lethargic in implementing flood control schemes and since most rivers flow through many states, it would be better if flood control is handled by the Centre. The mighty Himalayan rivers are unlikely to be tamed unless we have a basic understanding as to how floods originate. Since 1947, Indian and foreign scientists have been repeatedly emphasizing that the volume of water in the Himalayan rivers in the monsoons is the combined effect of rainfall, snow melt and glacier discharges. Even the first expert committed set up by Nehru had opined that a serious study of the snow melt and glacier discharges is essential for avoiding flood disasters in the north. In many places, they are just made of mud and sand and easily breached by a little gush of water. Other improvements should be in the regulation of water discharge from filled reservoirs and in the flood forecasting system. Even the present warning system, though inadequate, has helped to save many valuable lives and property. Since the states have been lethargic in implementing flood control schemes and since most rivers flow through many states, it would be better if flood control is handled by the Centre. The mighty Himalayan rivers are unlikely to be tamed unless we have a basic understanding as to how floods originate. Since 1947, Indian and foreign scientists have been repeatedly emphasizing that the volume of water in the Himalayan rivers in the monsoons is the combined effect of rainfall, snow melt and glacier discharges. Even the first expert committed set up by Nehru had opined that a serious study of the snow melt and glacier discharges is essential for avoiding flood disasters in the north. But efforts in this direction during the last 50 years have been very inadequate. Now that satellite pictures are available detailing the snow-cover in the Himalayas over large areas it would do well to initiate measures to obtain the relevant data from such pictures. Field studies in the Himalayan region would also help flood control measures.

The author seems to favour:

I. Traditional methods

## 5.2.146 English Language: CAT 1997 | Question: 96 top

**Read the passages given below carefully and answer the questions that follow.**

Water plays a versatile role in the functioning of the biosphere. The water cycle has two distinct branches – the atmospheric branch and the terrestrial branch. In the atmosphere, water exists mainly in gaseous form. On the earth, liquid forms and solid forms (ice/snow) predominate.

Water is important to the biosphere in that it is from water that the biosphere draws its most, abundant element, hydrogen.

Hydrogen in the form of carbohydrates constitutes a very important source of energy for all living things. Although we have a plentiful supply of water in the oceans, it is not of direct use to use. We have to depend upon a small stock of water - less than 1% - contained in our rivers and freshwater lakes and in the subsoil. Even this small proportion can cause havoc to life if it is not properly managed: the reference here is to floods.

While relief measures are undoubtedly important, attention has to be focused on long-term flood control measures. In the past, we had constructed flood moderation reservoirs across catchment's areas of rivers and built 19, 260 km of embankments and 27, 850 km length of drainage channels. Besides 18, 900 villages have been raised above the flood level up to March 1997.

The fact is that long-term flood control measures, to be effective, should include both traditional methods and a forestation measures. The intensity of floods may be reduced by keeping the drainage channels clear and removing the accumulated silt from reservoirs and riverbeds. In fact, the dams built have trapped silt coming from the hills and prevented its large accumulation in riverbeds downstream. Hence the new emphasis on building more dams in the northern rivers should be welcomed. The embankments also need to be reinforced. In many places, they are just made of mud and sand and easily breached by a little gush of water. Other improvements should be in the regulation of water discharge from filled reservoirs and in the flood forecasting system. Even the present warning system, though inadequate, has helped to save many valuable lives and property. Since the states have been lethargic in implementing flood control schemes and since most rivers flow through many states, it would be better if flood control is handled by the Centre. The mighty Himalayan rivers are unlikely to be tamed unless we have a basic understanding as to how floods originate. Since 1947, Indian and foreign scientists have been repeatedly emphasising that the volume of water in the Himalayan rivers in the monsoons is the combined effect of rainfall, snowmelt and glacier discharges. ## 5.2.151 English Language: CAT 1998 | Question: 100 top

Read the following passages and answer the questions based on each.

It is well known that industry is an important contributor to the development process of any country. Much of the developments are based on the use of increasing amount of raw materials, energy, chemicals and synthetics. The scale and complexity of requirements for these resources have increased greatly with the rising levels of population and production.

Following India's entry into the global market and the ever-increasing competition in the market, it has become necessary that apart from reduced manufacturing cost, industry must improve its profitability to survive and remain competitive in the international market. To a large extent the product cost in an industry is dependent on its diverted resources towards "End-of-Pipe" pollution control, where pollution created by the industry is treated after the waste has been generated. This approach first allows wasteful use of resources in manufacturing and then consumes further resources to resolve the environmental problems.

The experience over the last two decades has indicated that this approach is only a short term remedy and cannot lead to sustainable industrial developmental, particularly in developing countries. The additional financial burden brought about by the cost of pollution control and end-of-pipe treatment has dissuaded the industry from voluntary adopting pollution control approach. It is now being realised that it is better to adopt the preventive approach i.e. reduce the generation of pollution itself as against the curative approach of taking care after it has been created. It is therefore, important to adopt a strategy of pollution prevention based on technologies that conserve resources, minimise pollution and reuse wastes as secondary resources to the extent possible.

Cleaner Technologies (CT) are the practical application of knowledge, methods and means within the need of man, to provide the most rational use of natural resource and energy and in turn to protect the environment. Such technologies are based on improved manufacturing methods that require less raw materials and energy to obtain equitable levels of output of identical or better quality. Cleaner technologies also make greater, if not full, use of wastes and recyclable materials and are dependent upon innovation and high level of cooperation between different industries, particularly when exchanges of certain wastes are involved.

For this approach, different agencies prefer to use different terms. For example, UNEP uses the term "Cleaner Production", USEPA uses "Pollution Prevention" and UNIDO prefers to use "Waste Minimization". Some other names under which the concept is being advocated are "Low and non-waste Technologies", "Environmentally Sound Technologies", "Waste Recycling", "Residue Utilization" and "Resource Recovery Technologies".

There are three broad approaches in cleaner technologies of industrial production. (a) Waste minimization technologies involving raw material substitution, process changes, improved housekeeping, equipment redesign and product reformulation. (b) End-of-pipe treatment technologies involving recovery of raw materials, water, energy and useful byproducts. (c) Waste utilization technologies involving reclamation and utilization of wastes as secondary raw materials in other industrial units.

One good example that provides a cleaner technology scenario can be found in the agro-based sugar industry. The waste by products, such as sugarcane bagasse and molasses, form the key raw material for the pulp and paper and distillery industry, respectively. The press mud generated during the purification of juice which was a waste few years ago is now viewed as a rich source of clean energy. Not only this, press mud has proved to be a good organic manure for sugarcane crop. The reuse of hot condensate in juice extraction in the crusher units and as a boiler feed water, not only conserves the fresh water resources but also minimize the quantum of effluent discharge by the industry.

The use of surplus bagasse in the boiler house helps in conserving the energy resources and at the same time potash rich boiler ash is produced which is a good fertilizer for the sugarcane crop. According to an estimate by the Central Pollution Control Board (CPCB) approximately 15, 000 to 2, 000 litres of water is used per tonne of cane crushed. The recycling and reuse of hot condensate water can reduce this water consumption to as low as 100 to 200 litres. Proper house keeping, periodic checking and maintenance of pipe joints, valves and glands can further reduce this water consumption. Ideally, the industry can be brought down to zero effluent discharging unit.

Bio-methanation of spentwash in distillery industry, chrome recovery in tanneries, caustic recovery in large pulp and paper mills and fibre recovery in small pulp and paper industry are the few other options provided by cleaner technologies. Adoption of such technologies in these sectors would certainly reduce the burden on environment.

The major constraint to promotion of cleaner technologies is lack of information regarding needs of the industry, local

conditions, raw materials, and technologies available in developed countries. There is certain perceived risk that discourages entrepreneurs from adopting the relatively new concept of cleaner technologies. A combination of informational, financial, economic and legal measures, therefore, needs to be devised to promote waste minimization through cleaner technologies. There is also lack of coordination and direction in *R & D* efforts and inadequate thrust for technology transfer from laboratories to commercial scale. These problems arise mainly due to insufficient mission oriented approach of laboratories; inadequacy of design, pilot-scale demonstration of laboratory results; and low value placed on technology transfer by scientific and technological personnel engaged in *R & D* work.

To overcome these constraints, CPCB sponsored a project at NEERI, Nagpur to develop a database on cleaner technologies through analysis of information available nationally and internationally. This involved studying published literature, accessing established databases and interaction with the *R & D* centres within industries associations and eminent experts in the field and also technical wings of financial institutions. Information on 509 case studies have been collected for 14 industrial sectors. Regarding any information on cleaner technologies CPCB and NEERI can be approached by industries, consultants and other related organisations.

In order to disseminate information on cleaner technologies among the variety of industries, CPCB has planned industry wise seminars and workshops. The experiences from demonstration plants and feedback from the industries would be discussed in such seminars.

Investment in environmental technology gives ample opportunities to promote cleaner alternatives. With the appropriate measures adopted, one can not only increase profitability, but also minimize pollution generation. It is therefore, the need of the hour, to look into the positive aspects that cleaner technology, has provided to the industry and environment. This will certainly result into a healthy economy and cleaner environment.

What is the best meaning of "End of the Pipe" pollution control?

A. Avoiding generation of pollution in industrial pipes
B. Treatment of pollution waste after it has been generated by industry
C. Reducing the generation of pollutants in industries
D. Treatment of pollution by end of pipe technology.

Not only this, press mud has proved to be a good organic manure for sugarcane crop. The reuse of hot condensate in juice extraction in the crusher units and as a boiler feed water, not only conserves the fresh water resources but also minimize the quantum of effluent discharge by the industry.

The use of surplus bagasse in the boiler house helps in conserving the energy resources and at the same time potash rich boiler ash is produced which is a good fertilizer for the sugarcane crop. According to an estimate by the Central Pollution Control Board (CPCB) approximately 15, 000 to 2, 000 litres of water is used per tonne of cane crushed. The recycling and reuse of hot condensate water can reduce this water consumption to as low as 100 to 200 litres. Proper house keeping, periodic checking and maintenance of pipe joints, valves and glands can further reduce this water consumption. Ideally, the industry can be brought down to zero effluent discharging unit.

Bio-methanation of spentwash in distillery industry, chrome recovery in tanneries, caustic recovery in large pulp and paper mills and fibre recovery in small pulp and paper industry are the few other options provided by cleaner technologies. Adoption of such technologies in these sectors would certainly reduce the burden on environment.

The major constraint to promotion of cleaner technologies is lack of information regarding needs of the industry, local conditions, raw materials, and technologies available in developed countries. There is certain perceived risk that discourages entrepreneurs from adopting the relatively new concept of cleaner technologies. A combination of informational, financial, economic and legal measures, therefore, needs to be devised to promote waste minimization through cleaner technologies. There is also lack of coordination and direction in *R & D* efforts and inadequate thrust for technology transfer from laboratories to commercial scale. These problems arise mainly due to insufficient mission oriented approach of laboratories; inadequacy of design, pilot-scale demonstration of laboratory results; and low value placed on technology transfer by scientific and technological personnel engaged in *R & D* work.

To overcome these constraints, CPCB sponsored a project at NEERI, Nagpur to develop a database on cleaner technologies through analysis of information available nationally and internationally. This involved studying published literature, accessing established databases and interaction with the *R & D* centres within industries associations and eminent experts in the field and also technical wings of financial institutions. Information on 509 case studies have been collected for 14 industrial sectors. Regarding any information on cleaner technologies CPCB and NEERI can be approached by industries, consultants and other related organisations.

In order to disseminate information on cleaner technologies among the variety of industries, CPCB has planned industry wise seminars and workshops. The experiences from demonstration plants and feedback from the industries would be discussed in such seminars.

Investment in environmental technology gives ample opportunities to promote cleaner alternatives. With the appropriate measures adopted, one can not only increase profitability, but also minimize pollution generation. It is therefore, the need of the hour, to look into the positive aspects that cleaner technology, has provided to the industry and environment. This will certainly result into a healthy economy and cleaner environment.

Pollution control using cleaner technologies mainly involves which of the following approaches?

A. Waster utilisation technologies
B. Waste minimisation technologies
C. End of pipe treatment technologies
D. All of these

## 5.2.155 English Language: CAT 1998 | Question: 104 top

Read the following passages and answer the questions based on each.

It is well known that industry is an important contributor to the development process of any country. Much of the developments are based on the use of increasing amount of raw materials, energy, chemicals and synthetics. The scale and complexity of requirements for these resources have increased greatly with the rising levels of population and production.

Following India's entry into the global market and the ever-increasing competition in the market, it has become necessary that apart from reduced manufacturing cost, industry must improve its profitability to survive and remain competitive in the international market. To a large extent the product cost in an industry is dependent on its diverted resources towards "End-of-Pipe" pollution control, where pollution created by the industry is treated after the waste has been generated. This approach first allows wasteful use of resources in manufacturing and then consumes further resources to resolve the environmental problems.

The experience over the last two decades has indicated that this approach is only a short term remedy and cannot lead to sustainable industrial developmental, particularly in developing countries. The additional financial burden brought about by the cost of pollution control and end-of-pipe treatment has dissuaded the industry from voluntary adopting pollution control approach. It is now being realised that it is better to adopt the preventive approach i.e. reduce the generation of pollution itself as against the curative approach of taking care after it has been created. It is therefore, important to adopt a strategy of pollution prevention based on technologies that conserve resources, minimise pollution and reuse wastes as secondary resources to the extent possible.

Cleaner Technologies (CT) are the practical application of knowledge, methods and means within the need of man, to provide the most rational use of natural resource and energy and in turn to protect the environment. Such technologies are based on improved manufacturing methods that require less raw materials and energy to obtain equitable levels of output of identical or better quality. Cleaner technologies also make greater, if not full, use of wastes and recyclable materials and are dependent upon innovation and high level of cooperation between different industries, particularly when exchanges of certain wastes are involved.

For this approach, different agencies prefer to use different terms. For example, UNEP uses the term "Cleaner Production", USEPA uses "Pollution Prevention" and UNIDO prefers to use "Waste Minimization". Some other names under which the concept is being advocated are "Low and non-waste Technologies", "Environmentally Sound Technologies", "Waste Recycling", "Residue Utilization" and "Resource Recovery Technologies".

There are three broad approaches in cleaner technologies of industrial production. (a) Waste minimization technologies involving raw material substitution, process changes, improved housekeeping, equipment redesign and product reformulation. (b) End-of-pipe treatment technologies involving recovery of raw materials, water, energy and useful byproducts. (c) Waste utilization technologies involving reclamation and utilization of wastes as secondary raw materials in other industrial units.

One good example that provides a cleaner technology scenario can be found in the agro-based sugar industry. The waste by products, such as sugarcane bagasse and molasses, form the key raw material for the pulp and paper and distillery industry, respectively. The press mud generated during the purification of juice which was a waste few years ago is now viewed as a rich source of clean energy. Not only this, press mud has proved to be a good organic manure for sugarcane crop. The reuse of hot condensate in juice extraction in the crusher units and as a boiler feed water, not only conserves the fresh water resources but also minimize the quantum of effluent discharge by the industry.

The use of surplus bagasse in the boiler house helps in conserving the energy resources and at the same time potash rich boiler ash is produced which is a good fertilizer for the sugarcane crop. According to an estimate by the Central Pollution Control Board (CPCB) approximately 15, 000 to 2, 000 litres of water is used per tonne of cane crushed. The recycling and reuse of hot condensate water can reduce this water consumption to as low as 100 to 200 litres. Proper house keeping, periodic checking and maintenance of pipe joints, valves and glands can further reduce this water consumption. Ideally, the industry can be brought down to zero effluent discharging unit.

Bio-methanation of spentwash in distillery industry, chrome recovery in tanneries, caustic recovery in large pulp and paper mills and fibre recovery in small pulp and paper industry are the few other options provided by cleaner technologies. Adoption of such technologies in these sectors would certainly reduce the burden on environment.

The major constraint to promotion of cleaner technologies is lack of information regarding needs of the industry, local conditions, raw materials, and technologies available in developed countries. There is certain perceived risk that discourages entrepreneurs from adopting the relatively new concept of cleaner technologies. A combination of informational, financial, economic and legal measures, therefore, needs to be devised to promote waste minimization through cleaner technologies. There is also lack of coordination and direction in *R & D* efforts and inadequate thrust for technology transfer from laboratories to commercial scale. These problems arise mainly due to insufficient mission oriented approach of laboratories; inadequacy of design, pilot-scale demonstration of laboratory results; and low value placed on technology transfer by scientific and technological personnel engaged in *R & D* work.

It is therefore, the need of the hour, to look into the positive aspects that cleaner technology, has provided to the industry and environment. This will certainly result into a healthy economy and cleaner environment.

Which of the following processes shows that agro based sugar industry is a good example of cleaner technology?

A. The use of bagasse in boiler house
B. Bio-methanisation of spentwash
C. Caustic recovery
D. All of these

cat1998 english-language passage-reading

## 5.2.156 English Language: CAT 1998 | Question: 105 top

Read the following passages and answer the questions based on each.

For many Europeans, India evoked a picture of Maharajas, snake charmers, and the rope-trick. This has lent both allure and romanticism to things which are Indian. But in the last couple of decades, with the increasing reference to India as an economically under-developed country, the image of India as a vital, pulsating land has begun to emerge from the fog of Maharajas, snake-charmers, and the rope-trick. The Maharajas are now fast disappearing and the rope-trick was at best a hallucination. Only the snake-charmer remains: generally an ill-fed man who risks his life to catch a. snake, remove its poisonous fangs, and make it sway to the movement of the gourd pipe and all this in the hope of the occasional coin to feed him, his family, and the snake.

In the imagination of Europe, India had always been the fabulous land of untold wealth and mystical happenings, with more than just a normal share of wise men. From the gold digging ants to the philosophers who lived naked in the forests, these were all part of the picture which the ancient Greeks had of the Indians and this image persisted throughout many centuries. It might be more charitable not to destroy it, but to preserve it would mean to perpetuation of a myth.

Wealth in India, as in every other ancient culture, was limited to the few. Mystical activities were also the preoccupation of but a handful of people. It is true, however, that acceptance of such activities was characteristic of the majority. Whereas in some other cultures the rope-trick would have been ascribed to the prompting of the devil and all reference to it suppressed, in India it was regarded with amused benevolence. The fundamental sanity of Indian civilisation has been due to an absence of Satan.

The association of India with wealth, magic, and wisdom remained current for many centuries. But this attitude began to change in the nineteenth century when Europe entered the modern age, and the lack of enthusiasm for Indian culture in certain circles became almost proportionate to the earlier over- enthusiasm. It was now discovered that India had none of the qualities which the new Europe admired. There was apparently no stress on the values of rational thought and individualism. India's culture was a stagnant culture and was regarded with supreme disdain, an attitude perhaps best typified in Macaulay's contempt for things Indian. The political institutions of India, visualised largely as the rule of the Maharajas and Sultans, were dismissed as despotic and totally unrepresentative of public opinion. And this, in an age of democratic revolutions, was about the worst of sins.

Yet, a contrary opinion emerged from amongst a small section of European scholars who had discovered India largely through its ancient philosophy and its literature in Sanskrit. This attitude deliberately stressed the non-modern, non- utilitarian aspects of Indian culture, where the existence of a continuity of religion of over three thousand years was acclaimed; and where it was believed that the Indian pattern of life was so concerned with metaphysics and the subtleties of religious belief that there was no time for the mundane things of life. German romanticism was the most vehement in its support of this image of India: a vehemence which was to do as much damage to India as Macaulay's refection of Indian culture. India became the mystic land of many Europeans, where even the most ordinary actions were imbued with symbolism. India was the genesis of the spiritual East, and also, incidentally, the refuge of European intellectuals seeking escape from their own pattern of life. A dichotomy in values was maintained, Indian values being described as 'spiritual' and European values as 'materialistic', with little attempt at

placing these supposedly spiritual values in the context of Indian society (which might have led to some rather disturbing results). This theme was taken up by a section of Indian thinkers during the last hundred years and became a consolation to the Indian intelligentsia for its inability to compete with the technical superiority of Britain.

The discovery of the Indian past, and its revelation to Europe in the eighteenth century, was largely the work of Jesuits in India and of Europeans employed by the East India Company, such as Sir William Jones and Charles Wilkins. Soon the numbers of those interested in studying the classical languages and literatures of India grew, and the early nineteenth century saw considerable achievements in linguistics, ethnography, and other fields of Indology. Scholars in Europe expressed a keen interest in this new field, as is evident from the number of persons who took to Indology and of none of whom at least mention must be made

----F Max Mueller

According to the passage, the distinguishing trait which made the Indian civilisation sane, was:

A. The healthy attitudes which its people exhibited.
B. Its preoccupation with the esoteric.
C. Its indifference to magic.
D. The absence of Satan

## 5.2.162 English Language: CAT 1998 | Question: 110 top

Read the following passages and answer the questions based on each.

If western civilisation is in a state of permanent crisis, it is not far fetched to suggest that there may be something wrong with its education. No civilisation, I am sure, has ever devoted more energy and resources to organised education, and if we believe in nothing else, we certainly believe that education is, or should he, the key to everything In fact, the belief in education is so

strong that we treat it as the residual legatee of all our problems. If the nuclear age brings new danger; if the advance of genetic engineering opens the doors to new abuses; if commercialism brings new temptations; the answer must be more and better education. The modern way of life is becoming ever more complex: this means that everybody must become more highly educated. 'By 1984', it was said recently, 'it will be desirable that the most ordinary of men is not embarrassed by the use of a logarithm table, the elementary concepts of the calculus, and by the definitions and uses of such words as electron, coulomb, and volt. He should further have become able not only to handle a pen, pencil, and ruler but also a magnetic tape, valve, and transistor. The improvement of communications between individuals and groups depends on it.' Most of all, it appears, the international situation calls for prodigious educational efforts. The classical statement on this point was delivered by Sir Charles Snow in his 'Rede Lecture' some years ago: To say that we must educate ourselves or perish, is a little more melodramatic than the facts warrant. To say we have to educate ourselves or watch a steep decline in our lifetime, is about right, According to Lord Snow, the Russians are apparently doing much better than anyone else and will 'have a clear edge', 'unless and until the Americans and we educate ourselves both sensibly and imaginatively'.

Lord Snow it will he recalled, talked about 'The Two Cultures and the Scientific Revolution' and expressed his concern that 'the intellectual life of the whole of western society is increasingly being split into two polar groups ..... at one pole we have the literary intellectuals ….. at the other, the Scientists.' He deplores the 'gulf of mutual incomprehension' between these two groups and wants it bridged. It is quite clear how he thinks this bridging' operation is to be done: the aims of his educational policy would be. first, to get as many 'alpha-plus scientists as the country can throw up", second, to train 'a much larger stratum of alpha professionals' to do the supporting research, high class design and development; third, to train 'thousands upon thousands' of other scientists and engineers; and finally, to train 'politicians, administrators and the entire community, who know enough science to have a sense of what the scientists are talking about'. If this fourth and last group can at least be educated enough to 'have sense' of what the real people. the scientists and engineers, are talking about, so Lord Snow seems to suggest, the gulf of mutual incomprehension between the 'Two Cultures' may be bridged.

These ideas on education, which are by no means unrepresentative of our times, leave one within the uncomfortable feeling that ordinary people, including politicians, administrators, and so forth, are really not much use; they have failed to make the grade: but, at least, they should be educated enough to have a sense of what is going on, and to know what the scientists mean when they talk, to quote Lord Snow's example about the Second Law of Thermodynamics. It is an uncomfortable feeling, because the scientists never tire of telling us that the fruits of their labours are 'neutral': whether they enrich humanity or destroy it depends on how they are used. And who is to decide how they are used? There is nothing in the training of scientists and engineers to enable them to take such decisions, or else, what becomes of the neutrality of science?

If so much reliance is today being placed in the power of education to enable ordinary people to cope with the problems thrown up by scientific and technological progress, then there must be something more to education than Lord Snow suggests. Science and engineering produce 'know-how'; is one more a culture than a piano is music, can education help us to finish the sentence, to turn the potentiality into a reality to the benefit of man?

To do so, the task of education would be, first and foremost, the transmission of ideas of value of what to do with our lives. There is no doubt also the need to transmit know-how but this must take second place, for it is obviously somewhat foolhardy to put great powers into the hands of people without making sure that they have a reasonable idea of what to do with them. At present, there can be little doubt that the whole of mankind is in mortal danger, not because we are short of scientific and technological know-how, but because we tend to use it destructively, without wisdom. More education can help us only if it produces more wisdom.

The essence of education, I suggest, is the transmission of values, but values do not help us to pick our way through life unless they have become our own, a part, so to say, of our mental make-up. This means that they are more than mere formulae or dogmatic assertions: that we think and feel with them, that they are the very instruments through which we like at interpret, and experience the world. When we think, we do not just think: we think with ideas. Our mind is not a blank, a tabula rasa. When we begin to think we can do so only because our mind is already filled with all sorts of ideas with which to think. All through our youth and adolescence, before the conscious and critical mind begins to act as a sort of censor and guardian at the threshold, ideas seep into our mind, vast hosts and multitudes of them. These years are, one might say, our Dark Ages during which we are nothing but inheritors; it is only in later years that we can gradually learn to sort out our inheritance.

First of all, there is language. Each word is an idea. If the language which seeps into us during our Dark Ages is English, our mind is thereby furnished by a set of ideas which is significantly different from the set represented by Chinese, Russian, German, or even American. Next to word, there are the rules of putting them together: grammar, another bundle of ideas, the study of which has fascinated some modern philosophers to such an extent that they thought they could reduce the whole of philosophy to a study of grammar.

All philosophers and others have always paid a great deal of attention to ideas seen as the result of thought and observation; but in modern times all too little attention has been paid to the study of the ideas which form the very instruments by which thought and observation proceed. On the basis of experience and conscious thought, small ideas may easily be dislodged, but when it comes to bigger, more universal, or more subtle ideas it may not be so easy to change them. Indeed, it is often difficult to become aware of them, as they are the instruments and not the results of our thinking, just as you can see what is outside you, but cannot easily see that with which you see, the eye itself. And even when one has become aware, it is often impossible to judge them on the basis on ordinary experience.

We often notice the existence of more or less fixed ideas in other people's minds — ideas with which they think without being aware of doing so. We then call them prejudices, which is logically quite correct because they have merely seeped into the mind and are in no way the result of Judgement. But the word prejudice is generally applied to ideas that are patently

erroneous.

Recognisable as such by anyone except the prejudiced man, most of the ideas with which we think are not of that kind at all. To some of them, like those incorporated in words and grammar, the notions of truth or error cannot even be applied, others are quite definitely not prejudices but the result of a Judgement; others again are tacit assumptions or presuppositions which may be very difficult to recognise.

I say, therefore, that we think with or through ideas and that what we call thinking is generally the application of preexisting ideas to a given situation or set of facts. When we think about, say the political situation, we apply to that situation our political ideas, more or less systematically, and attempt to make the situation 'intelligible' to ourselves by means of these ideas. Similarly everywhere else. Some of the ideas are ideas of value, that is to say, we evaluate the situation in the light of our value-ideas.

The way in which we experience and interpret the world obviously depends very much indeed on kind of ideas that fill our minds. If they are mainly small, weak, superficial, and incoherent, life will appear insipid, uninteresting, petty and chaotic. It is difficult to bear the resultant feeling of emptiness, and the vacuum of our minds may only too easily be filled by some big, fantastic notion - political or otherwise -which suddenly seem to illumine everything and to give meaning and purpose to our existence. It needs no emphasis that herein lies one of tile great danger of our time.

When people ask for education they normally mean something more than mere training, something more than mere knowledge of facts, and something more than a mere diversion. May be they cannot themselves formulate precisely what they are looking for; but I think what they are really looking for is ideas that could make the world, and their own lives, intelligible to them. When a thing is intelligible you have a sense of participation; when a thing is unintelligible you have a sense of estrangement. ‘Well, I don’t know,’ you hear people say, as an impotent protest against the unintelligibility of the world as they meet it. If the mind cannot bring to the world a set - or, shall we say, a tool-box - of powerful ideas, the world must appear to it as a chaos, a mass of unrelated phenomena, of meaningless events. Such a man is like a person in a strange land without any meaning to him; nothing can hold his vital interest; he has no means of making anything intelligible to himself.

The writer seems to criticise the belief that:

A. Education gives rise to further complexities as the civilisation progresses.
B. All new problems and complexities can be tackled and solved by more and better education.
C. People need to learn more in order to earn more.
D. None of the above.

## 5.2.163 English Language: CAT 1998 | Question: 111 top

Read the following passages and answer the questions based on each.

If western civilisation is in a state of permanent crisis, it is not far fetched to suggest that there may be something wrong with its education. No civilisation, I am sure, has ever devoted more energy and resources to organised education, and if we believe in nothing else, we certainly believe that education is, or should he, the key to everything In fact, the belief in education is so strong that we treat it as the residual legatee of all our problems. If the nuclear age brings new danger; if the advance of genetic engineering opens the doors to new abuses; if commercialism brings new temptations; the answer must be more and better education. The modern way of life is becoming ever more complex: this means that everybody must become more highly educated. 'By 1984', it was said recently, 'it will be desirable that the most ordinary of men is not embarrassed by the use of a logarithm table, the elementary concepts of the calculus, and by the definitions and uses of such words as electron, coulomb, and volt. He should further have become able not only to handle a pen, pencil, and ruler but also a magnetic tape, valve, and transistor. The improvement of communications between individuals and groups depends on it.’ Most of all, it appears, the international situation calls for prodigious educational efforts. The classical statement on this point was delivered by Sir Charles Snow in his ‘Rede Lecture’ some years ago: To say that we must educate ourselves or perish, is a little more melodramatic than the facts warrant. To say we have to educate ourselves or watch a steep decline in our lifetime, is about right, According to Lord Snow, the Russians are apparently doing much better than anyone else and will ‘have a clear edge', 'unless and until the Americans and we educate ourselves both sensibly and imaginatively’.

Lord Snow it will he recalled, talked about 'The Two Cultures and the Scientific Revolution' and expressed his concern that ‘the intellectual life of the whole of western society is increasingly being split into two polar groups ..... at one pole we have the literary intellectuals ….. at the other, the Scientists.’ He deplores the ‘gulf of mutual incomprehension’ between these two groups and wants it bridged. It is quite clear how he thinks this bridging’ operation is to be done: the aims of his educational policy would be. first, to get as many ‘alpha-plus scientists as the country can throw up", second, to train ‘a much larger stratum of alpha professionals’ to do the supporting research, high class design and development; third, to train ‘thousands upon thousands’ of other scientists and engineers; and finally, to train ‘politicians, administrators and the entire community, who know enough science to have a sense of what the scientists are talking about'. If this fourth and last group can at least be educated enough to ‘have sense’ of what the real people. the scientists and engineers, are talking about, so Lord Snow seems to suggest, the gulf of mutual incomprehension between the 'Two Cultures' may be bridged.

These ideas on education, which are by no means unrepresentative of our times, leave one within the uncomfortable feeling

that ordinary people, including politicians, administrators, and so forth, are really not much use; they have failed to make the grade: but, at least, they should be educated enough to have a sense of what is going on, and to know what the scientists mean when they talk, to quote Lord Snow's example about the Second Law of Thermodynamics. It is an uncomfortable feeling, because the scientists never tire of telling us that the fruits of their labours are 'neutral': whether they enrich humanity or destroy it depends on how they are used. And who is to decide how they are used? There is nothing in the training of scientists and engineers to enable them to take such decisions, or else, what becomes of the neutrality of science?

If so much reliance is today being placed in the power of education to enable ordinary people to cope with the problems thrown up by scientific and technological progress, then there must be something more to education than Lord Snow suggests. Science and engineering produce 'know-how'; is one more a culture than a piano is music, can education help us to finish the sentence, to turn the potentiality into a reality to the benefit of man?

To do so, the task of education would be, first and foremost, the transmission of ideas of value of what to do with our lives. There is no doubt also the need to transmit know-how but this must take second place, for it is obviously somewhat foolhardy to put great powers into the hands of people without making sure that they have a reasonable idea of what to do with them. At present, there can be little doubt that the whole of mankind is in mortal danger, not because we are short of scientific and technological know-how, but because we tend to use it destructively, without wisdom. More education can help us only if it produces more wisdom.

The essence of education, I suggest, is the transmission of values, but values do not help us to pick our way through life unless they have become our own, a part, so to say, of our mental make-up. This means that they are more than mere formulae or dogmatic assertions: that we think and feel with them, that they are the very instruments through which we like at interpret, and experience the world. When we think, we do not just think: we think with ideas. Our mind is not a blank, a tabula rasa. When we begin to think we can do so only because our mind is already filled with all sorts of ideas with which to think. All through our youth and adolescence, before the conscious and critical mind begins to act as a sort of censor and guardian at the threshold, ideas seep into our mind, vast hosts and multitudes of them. These years are, one might say, our Dark Ages during which we are nothing but inheritors; it is only in later years that we can gradually learn to sort out our inheritance.

First of all, there is language. Each word is an idea. If the language which seeps into us during our Dark Ages is English, our mind is thereby furnished by a set of ideas which is significantly different from the set represented by Chinese, Russian, German, or even American. Next to word, there are the rules of putting them together: grammar, another bundle of ideas, the study of which has fascinated some modern philosophers to such an extent that they thought they could reduce the whole of philosophy to a study of grammar.

All philosophers and others have always paid a great deal of attention to ideas seen as the result of thought and observation; but in modern times all too little attention has been paid to the study of the ideas which form the very instruments by which thought and observation proceed. On the basis of experience and conscious thought, small ideas may easily be dislodged, but when it comes to bigger, more universal, or more subtle ideas it may not be so easy to change them. Indeed, it is often difficult to become aware of them, as they are the instruments and not the results of our thinking, just as you can see what is outside you, but cannot easily see that with which you see, the eye itself. And even when one has become aware, it is often impossible to judge them on the basis on ordinary experience.

We often notice the existence of more or less fixed ideas in other people's minds — ideas with which they think without being aware of doing so. We then call them prejudices, which is logically quite correct because they have merely seeped into the mind and are in no way the result of Judgement. But the word prejudice is generally applied to ideas that are patently erroneous.

Recognisable as such by anyone except the prejudiced man, most of the ideas with which we think are not of that kind at all. To some of them, like those incorporated in words and grammar, the notions of truth or error cannot even be applied, others are quite definitely not prejudices but the result of a Judgement; others again are tacit assumptions or presuppositions which may be very difficult to recognise.

I say, therefore, that we think with or through ideas and that what we call thinking is generally the application of preexisting ideas to a given situation or set of facts. When we think about, say the political situation, we apply to that situation our political ideas, more or less systematically, and attempt to make the situation 'intelligible' to ourselves by means of these ideas. Similarly everywhere else. Some of the ideas are ideas of value, that is to say, we evaluate the situation in the light of our value-ideas.

The way in which we experience and interpret the world obviously depends very much indeed on kind of ideas that fill our minds. If they are mainly small, weak, superficial, and incoherent, life will appear insipid, uninteresting, petty and chaotic. It is difficult to bear the resultant feeling of emptiness, and the vacuum of our minds may only too easily be filled by some big, fantastic notion - political or otherwise -which suddenly seem to illumine everything and to give meaning and purpose to our existence. It needs no emphasis that herein lies one of tile great danger of our time.

When people ask for education they normally mean something more than mere training, something more than mere knowledge of facts, and something more than a mere diversion. May be they cannot themselves formulate precisely what they are looking for; but I think what they are really looking for is ideas that could make the world, and their own lives, intelligible to them. When a thing is intelligible you have a sense of participation; when a thing is unintelligible you have a sense of estrangement. 'Well, I don't know,' you hear people say, as an impotent protest against the unintelligibility of the world as they meet it. If the mind cannot bring to the world a set - or, shall we say, a tool-box - of powerful ideas, the world must appear to it as a chaos, a mass of unrelated phenomena, of meaningless events. Such a man is like a person in a strange land without any meaning to

him; nothing can hold his vital interest; he has no means of making anything intelligible to himself.

What, according to the author, would be the definition of ‘prejudice’?

A. Ideas that help people to identify with new situations.
B. Fixed ideas with which people think without being aware of doing so.
C. Ideas that people cull from experience in order to judge a situation.
D. Fixed ideas that see a person through the trials and tribulations of life.

## 5.2.164 English Language: CAT 1998 | Question: 112 top

Read the following passages and answer the questions based on each.

If western civilisation is in a state of permanent crisis, it is not far fetched to suggest that there may be something wrong with its education. No civilisation, I am sure, has ever devoted more energy and resources to organised education, and if we believe in nothing else, we certainly believe that education is, or should he, the key to everything In fact, the belief in education is so strong that we treat it as the residual legatee of all our problems. If the nuclear age brings new danger; if the advance of genetic engineering opens the doors to new abuses; if commercialism brings new temptations; the answer must be more and better education. The modern way of life is becoming ever more complex: this means that everybody must become more highly educated. 'By 1984', it was said recently, 'it will be desirable that the most ordinary of men is not embarrassed by the use of a logarithm table, the elementary concepts of the calculus, and by the definitions and uses of such words as electron, coulomb, and volt. He should further have become able not only to handle a pen, pencil, and ruler but also a magnetic tape, valve, and transistor. The improvement of communications between individuals and groups depends on it.’ Most of all, it appears, the international situation calls for prodigious educational efforts. The classical statement on this point was delivered by Sir Charles Snow in his ‘Rede Lecture’ some years ago: To say that we must educate ourselves or perish, is a little more melodramatic than the facts warrant. To say we have to educate ourselves or watch a steep decline in our lifetime, is about right, According to Lord Snow, the Russians are apparently doing much better than anyone else and will ‘have a clear edge', 'unless and until the Americans and we educate ourselves both sensibly and imaginatively’.

Lord Snow it will he recalled, talked about 'The Two Cultures and the Scientific Revolution' and expressed his concern that ‘the intellectual life of the whole of western society is increasingly being split into two polar groups ..... at one pole we have the literary intellectuals ….. at the other, the Scientists.’ He deplores the ‘gulf of mutual incomprehension’ between these two groups and wants it bridged. It is quite clear how he thinks this bridging’ operation is to be done: the aims of his educational policy would be. first, to get as many ‘alpha-plus scientists as the country can throw up", second, to train ‘a much larger stratum of alpha professionals’ to do the supporting research, high class design and development; third, to train ‘thousands upon thousands’ of other scientists and engineers; and finally, to train ‘politicians, administrators and the entire community, who know enough science to have a sense of what the scientists are talking about'. If this fourth and last group can at least be educated enough to ‘have sense’ of what the real people. the scientists and engineers, are talking about, so Lord Snow seems to suggest, the gulf of mutual incomprehension between the 'Two Cultures' may be bridged.

These ideas on education, which are by no means unrepresentative of our times, leave one within the uncomfortable feeling that ordinary people, including politicians, administrators, and so forth, are really not much use; they have failed to make the grade: but, at least, they should be educated enough to have a sense of what is going on, and to know what the scientists mean when they talk, to quote Lord Snow’s example about the Second Law of Thermodynamics. It is an uncomfortable feeling, because the scientists never tire of telling us that the fruits of their labours are ‘neutral’: whether they enrich humanity or destroy it depends on how they are used. And who is to decide how they are used? There is nothing in the training of scientists and engineers to enable them to take such decisions, or else, what becomes of the neutrality of science?

If so much reliance is today being placed in the power of education to enable ordinary people to cope with the problems thrown up by scientific and technological progress, then there must be something more to education than Lord Snow suggests. Science and engineering produce ‘know-how’; is one more a culture than a piano is music, can education help us to finish the sentence, to turn the potentiality into a reality to the benefit of man?

To do so, the task of education would be, first and foremost, the transmission of ideas of value of what to do with our lives. There is no doubt also the need to transmit know-how but this must take second place, for it is obviously somewhat foolhardy to put great powers into the hands of people without making sure that they have a reasonable idea of what to do with them. At present, there can be little doubt that the whole of mankind is in mortal danger, not because we are short of scientific and technological know-how, but because we tend to use it destructively, without wisdom. More education can help us only if it produces more wisdom.

The essence of education, I suggest, is the transmission of values, but values do not help us to pick our way through life unless they have become our own, a part, so to say, of our mental make-up. This means that they are more than mere formulae or dogmatic assertions: that we think and feel with them, that they are the very instruments through which we like at interpret, and experience the world. When we think, we do not just think: we think with ideas. Our mind is not a blank, a tabula rasa. When we begin to think we can do so only because our mind is already filled with all sorts of ideas with which to think. All through our youth and adolescence, before the conscious and critical mind begins to act as a sort of censor and guardian at the threshold, ideas seep into our mind, vast hosts and multitudes of them. These years are, one might say, our Dark Ages during

which we are nothing but inheritors; it is only in later years that we can gradually learn to sort out our inheritance.

First of all, there is language. Each word is an idea. If the language which seeps into us during our Dark Ages is English, our mind is thereby furnished by a set of ideas which is significantly different from the set represented by Chinese, Russian, German, or even American. Next to word, there are the rules of putting them together: grammar, another bundle of ideas, the study of which has fascinated some modern philosophers to such an extent that they thought they could reduce the whole of philosophy to a study of grammar.

All philosophers and others have always paid a great deal of attention to ideas seen as the result of thought and observation; but in modern times all too little attention has been paid to the study of the ideas which form the very instruments by which thought and observation proceed. On the basis of experience and conscious thought, small ideas may easily be dislodged, but when it comes to bigger, more universal, or more subtle ideas it may not be so easy to change them. Indeed, it is often difficult to become aware of them, as they are the instruments and not the results of our thinking, just as you can see what is outside you, but cannot easily see that with which you see, the eye itself. And even when one has become aware, it is often impossible to judge them on the basis on ordinary experience.

We often notice the existence of more or less fixed ideas in other people's minds — ideas with which they think without being aware of doing so. We then call them prejudices, which is logically quite correct because they have merely seeped into the mind and are in no way the result of Judgement. But the word prejudice is generally applied to ideas that are patently erroneous.

Recognisable as such by anyone except the prejudiced man, most of the ideas with which we think are not of that kind at all. To some of them, like those incorporated in words and grammar, the notions of truth or error cannot even be applied, others are quite definitely not prejudices but the result of a Judgement; others again are tacit assumptions or presuppositions which may be very difficult to recognise.

I say, therefore, that we think with or through ideas and that what we call thinking is generally the application of preexisting ideas to a given situation or set of facts. When we think about, say the political situation, we apply to that situation our political ideas, more or less systematically, and attempt to make the situation 'intelligible' to ourselves by means of these ideas. Similarly everywhere else. Some of the ideas are ideas of value, that is to say, we evaluate the situation in the light of our value-ideas.

The way in which we experience and interpret the world obviously depends very much indeed on kind of ideas that fill our minds. If they are mainly small, weak, superficial, and incoherent, life will appear insipid, uninteresting, petty and chaotic. It is difficult to bear the resultant feeling of emptiness, and the vacuum of our minds may only too easily be filled by some big, fantastic notion - political or otherwise -which suddenly seem to illumine everything and to give meaning and purpose to our existence. It needs no emphasis that herein lies one of tile great danger of our time.

When people ask for education they normally mean something more than mere training, something more than mere knowledge of facts, and something more than a mere diversion. May be they cannot themselves formulate precisely what they are looking for; but I think what they are really looking for is ideas that could make the world, and their own lives, intelligible to them. When a thing is intelligible you have a sense of participation; when a thing is unintelligible you have a sense of estrangement. 'Well, I don't know,' you hear people say, as an impotent protest against the unintelligibility of the world as they meet it. ## 5.2.165 English Language: CAT 1998 | Question: 113 top

Read the following passages and answer the questions based on each.

If western civilisation is in a state of permanent crisis, it is not far fetched to suggest that there may be something wrong with its education. No civilisation, I am sure, has ever devoted more energy and resources to organised education, and if we believe in nothing else, we certainly believe that education is, or should he, the key to everything In fact, the belief in education is so strong that we treat it as the residual legatee of all our problems. If the nuclear age brings new danger; if the advance of genetic engineering opens the doors to new abuses; if commercialism brings new temptations; the answer must be more and better education. The modern way of life is becoming ever more complex: this means that everybody must become more highly educated. 'By 1984', it was said recently, 'it will be desirable that the most ordinary of men is not embarrassed by the use of a logarithm table, the elementary concepts of the calculus, and by the definitions and uses of such words as electron, coulomb, and volt. He should further have become able not only to handle a pen, pencil, and ruler but also a magnetic tape, valve, and transistor. The improvement of communications between individuals and groups depends on it.' Most of all, it appears, the international situation calls for prodigious educational efforts. The classical statement on this point was delivered by Sir Charles Snow in his 'Rede Lecture' some years ago: To say that we must educate ourselves or perish, is a little more

melodramatic than the facts warrant. To say we have to educate ourselves or watch a steep decline in our lifetime, is about right, According to Lord Snow, the Russians are apparently doing much better than anyone else and will ‘have a clear edge', 'unless and until the Americans and we educate ourselves both sensibly and imaginatively’.

Lord Snow it will he recalled, talked about 'The Two Cultures and the Scientific Revolution' and expressed his concern that ‘the intellectual life of the whole of western society is increasingly being split into two polar groups ..... at one pole we have the literary intellectuals ….. at the other, the Scientists.’ He deplores the ‘gulf of mutual incomprehension’ between these two groups and wants it bridged. It is quite clear how he thinks this bridging’ operation is to be done: the aims of his educational policy would be. first, to get as many ‘alpha-plus scientists as the country can throw up", second, to train ‘a much larger stratum of alpha professionals’ to do the supporting research, high class design and development; third, to train ‘thousands upon thousands’ of other scientists and engineers; and finally, to train ‘politicians, administrators and the entire community, who know enough science to have a sense of what the scientists are talking about'. If this fourth and last group can at least be educated enough to ‘have sense’ of what the real people. the scientists and engineers, are talking about, so Lord Snow seems to suggest, the gulf of mutual incomprehension between the 'Two Cultures' may be bridged.

These ideas on education, which are by no means unrepresentative of our times, leave one within the uncomfortable feeling that ordinary people, including politicians, administrators, and so forth, are really not much use; they have failed to make the grade: but, at least, they should be educated enough to have a sense of what is going on, and to know what the scientists mean when they talk, to quote Lord Snow’s example about the Second Law of Thermodynamics. It is an uncomfortable feeling, because the scientists never tire of telling us that the fruits of their labours are ‘neutral’: whether they enrich humanity or destroy it depends on how they are used. And who is to decide how they are used? There is nothing in the training of scientists and engineers to enable them to take such decisions, or else, what becomes of the neutrality of science?

If so much reliance is today being placed in the power of education to enable ordinary people to cope with the problems thrown up by scientific and technological progress, then there must be something more to education than Lord Snow suggests. Science and engineering produce ‘know-how’; is one more a culture than a piano is music, can education help us to finish the sentence, to turn the potentiality into a reality to the benefit of man?

To do so, the task of education would be, first and foremost, the transmission of ideas of value of what to do with our lives. There is no doubt also the need to transmit know-how but this must take second place, for it is obviously somewhat foolhardy to put great powers into the hands of people without making sure that they have a reasonable idea of what to do with them. At present, there can be little doubt that the whole of mankind is in mortal danger, not because we are short of scientific and technological know-how, but because we tend to use it destructively, without wisdom. More education can help us only if it produces more wisdom.

The essence of education, I suggest, is the transmission of values, but values do not help us to pick our way through life unless they have become our own, a part, so to say, of our mental make-up. This means that they are more than mere formulae or dogmatic assertions: that we think and feel with them, that they are the very instruments through which we like at interpret, and experience the world. When we think, we do not just think: we think with ideas. Our mind is not a blank, a tabula rasa. When we begin to think we can do so only because our mind is already filled with all sorts of ideas with which to think. All through our youth and adolescence, before the conscious and critical mind begins to act as a sort of censor and guardian at the threshold, ideas seep into our mind, vast hosts and multitudes of them. These years are, one might say, our Dark Ages during which we are nothing but inheritors; it is only in later years that we can gradually learn to sort out our inheritance.

First of all, there is language. Each word is an idea. If the language which seeps into us during our Dark Ages is English, our mind is thereby furnished by a set of ideas which is significantly different from the set represented by Chinese, Russian, German, or even American. Next to word, there are the rules of putting them together: grammar, another bundle of ideas, the study of which has fascinated some modern philosophers to such an extent that they thought they could reduce the whole of philosophy to a study of grammar.

All philosophers and others have always paid a great deal of attention to ideas seen as the result of thought and observation; but in modern times all too little attention has been paid to the study of the ideas which form the very instruments by which thought and observation proceed. On the basis of experience and conscious thought, small ideas may easily be dislodged, but when it comes to bigger, more universal, or more subtle ideas it may not be so easy to change them. Indeed, it is often difficult to become aware of them, as they are the instruments and not the results of our thinking, just as you can see what is outside you, but cannot easily see that with which you see, the eye itself. And even when one has become aware, it is often impossible to judge them on the basis on ordinary experience.

We often notice the existence of more or less fixed ideas in other people’s minds — ideas with which they think without being aware of doing so. We then call them prejudices, which is logically quite correct because they have merely seeped into the mind and are in no way the result of Judgement. But the word prejudice is generally applied to ideas that are patently erroneous.

Recognisable as such by anyone except the prejudiced man, most of the ideas with which we think are not of that kind at all. To some of them, like those incorporated in words and grammar, the notions of truth or error cannot even be applied, others are quite definitely not prejudices but the result of a Judgement; others again are tacit assumptions or presuppositions which may be very difficult to recognise.

I say, therefore, that we think with or through ideas and that what we call thinking is generally the application of preexisting ideas to a given situation or set of facts. When we think about, say the political situation, we apply to that situation our political ideas, more or less systematically, and attempt to make the situation 'intelligible' to ourselves by means of these ideas.

Similarly everywhere else. Some of the ideas are ideas of value, that is to say, we evaluate the situation in the light of our value-ideas.

The way in which we experience and interpret the world obviously depends very much indeed on kind of ideas that fill our minds. If they are mainly small, weak, superficial, and incoherent, life will appear insipid, uninteresting, petty and chaotic. It is difficult to bear the resultant feeling of emptiness, and the vacuum of our minds may only too easily be filled by some big, fantastic notion - political or otherwise -which suddenly seem to illumine everything and to give meaning and purpose to our existence. It needs no emphasis that herein lies one of tile great danger of our time.

When people ask for education they normally mean something more than mere training, something more than mere knowledge of facts, and something more than a mere diversion. May be they cannot themselves formulate precisely what they are looking for; but I think what they are really looking for is ideas that could make the world, and their own lives, intelligible to them. When a thing is intelligible you have a sense of participation; when a thing is unintelligible you have a sense of estrangement. 'Well, I don't know,' you hear people say, as an impotent protest against the unintelligibility of the world as they meet it. If the mind cannot bring to the world a set - or, shall we say, a tool-box - of powerful ideas, the world must appear to it as a chaos, a mass of unrelated phenomena, of meaningless events. Such a man is like a person in a strange land without any meaning to him; nothing can hold his vital interest; he has no means of making anything intelligible to himself.

In the passage, the writer questions:

A. the neutrality of science.
B. scientists' stand on the neutrality of science.
C. scientists' stand on the neutrality of their labours.
D. Lord Snow's assertion regarding the potential of intellectuals in society.

## 5.2.166 English Language: CAT 1998 | Question: 114 top

Read the following passages and answer the questions based on each.

If western civilisation is in a state of permanent crisis, it is not far fetched to suggest that there may be something wrong with its education. No civilisation, I am sure, has ever devoted more energy and resources to organised education, and if we believe in nothing else, we certainly believe that education is, or should he, the key to everything In fact, the belief in education is so strong that we treat it as the residual legatee of all our problems. If the nuclear age brings new danger; if the advance of genetic engineering opens the doors to new abuses; if commercialism brings new temptations; the answer must be more and better education. The modern way of life is becoming ever more complex: this means that everybody must become more highly educated. 'By 1984', it was said recently, 'it will be desirable that the most ordinary of men is not embarrassed by the use of a logarithm table, the elementary concepts of the calculus, and by the definitions and uses of such words as electron, coulomb, and volt. He should further have become able not only to handle a pen, pencil, and ruler but also a magnetic tape, valve, and transistor. The improvement of communications between individuals and groups depends on it.' Most of all, it appears, the international situation calls for prodigious educational efforts. The classical statement on this point was delivered by Sir Charles Snow in his 'Rede Lecture' some years ago: To say that we must educate ourselves or perish, is a little more melodramatic than the facts warrant. To say we have to educate ourselves or watch a steep decline in our lifetime, is about right, According to Lord Snow, the Russians are apparently doing much better than anyone else and will 'have a clear edge', 'unless and until the Americans and we educate ourselves both sensibly and imaginatively'.

Lord Snow it will he recalled, talked about 'The Two Cultures and the Scientific Revolution' and expressed his concern that 'the intellectual life of the whole of western society is increasingly being split into two polar groups ..... at one pole we have the literary intellectuals ….. at the other, the Scientists.' He deplores the 'gulf of mutual incomprehension' between these two groups and wants it bridged. It is quite clear how he thinks this bridging' operation is to be done: the aims of his educational policy would be. first, to get as many 'alpha-plus scientists as the country can throw up", second, to train 'a much larger stratum of alpha professionals' to do the supporting research, high class design and development; third, to train 'thousands upon thousands' of other scientists and engineers; and finally, to train 'politicians, administrators and the entire community, who know enough science to have a sense of what the scientists are talking about'. If this fourth and last group can at least be educated enough to 'have sense' of what the real people. the scientists and engineers, are talking about, so Lord Snow seems to suggest, the gulf of mutual incomprehension between the 'Two Cultures' may be bridged.

These ideas on education, which are by no means unrepresentative of our times, leave one within the uncomfortable feeling that ordinary people, including politicians, administrators, and so forth, are really not much use; they have failed to make the grade: but, at least, they should be educated enough to have a sense of what is going on, and to know what the scientists mean when they talk, to quote Lord Snow's example about the Second Law of Thermodynamics. It is an uncomfortable feeling, because the scientists never tire of telling us that the fruits of their labours are 'neutral': whether they enrich humanity or destroy it depends on how they are used. And who is to decide how they are used? There is nothing in the training of scientists and engineers to enable them to take such decisions, or else, what becomes of the neutrality of science?

If so much reliance is today being placed in the power of education to enable ordinary people to cope with the problems thrown up by scientific and technological progress, then there must be something more to education than Lord Snow suggests. Science and engineering produce 'know-how'; is one more a culture than a piano is music, can education help us to finish the sentence,

to turn the potentiality into a reality to the benefit of man?

To do so, the task of education would be, first and foremost, the transmission of ideas of value of what to do with our lives. There is no doubt also the need to transmit know-how but this must take second place, for it is obviously somewhat foolhardy to put great powers into the hands of people without making sure that they have a reasonable idea of what to do with them. At present, there can be little doubt that the whole of mankind is in mortal danger, not because we are short of scientific and technological know-how, but because we tend to use it destructively, without wisdom. More education can help us only if it produces more wisdom.

The essence of education, I suggest, is the transmission of values, but values do not help us to pick our way through life unless they have become our own, a part, so to say, of our mental make-up. This means that they are more than mere formulae or dogmatic assertions: that we think and feel with them, that they are the very instruments through which we like at interpret, and experience the world. When we think, we do not just think: we think with ideas. Our mind is not a blank, a tabula rasa. When we begin to think we can do so only because our mind is already filled with all sorts of ideas with which to think. All through our youth and adolescence, before the conscious and critical mind begins to act as a sort of censor and guardian at the threshold, ideas seep into our mind, vast hosts and multitudes of them. These years are, one might say, our Dark Ages during which we are nothing but inheritors; it is only in later years that we can gradually learn to sort out our inheritance.

First of all, there is language. Each word is an idea. If the language which seeps into us during our Dark Ages is English, our mind is thereby furnished by a set of ideas which is significantly different from the set represented by Chinese, Russian, German, or even American. Next to word, there are the rules of putting them together: grammar, another bundle of ideas, the study of which has fascinated some modern philosophers to such an extent that they thought they could reduce the whole of philosophy to a study of grammar.

All philosophers and others have always paid a great deal of attention to ideas seen as the result of thought and observation; but in modern times all too little attention has been paid to the study of the ideas which form the very instruments by which thought and observation proceed. On the basis of experience and conscious thought, small ideas may easily be dislodged, but when it comes to bigger, more universal, or more subtle ideas it may not be so easy to change them. Indeed, it is often difficult to become aware of them, as they are the instruments and not the results of our thinking, just as you can see what is outside you, but cannot easily see that with which you see, the eye itself. And even when one has become aware, it is often impossible to judge them on the basis on ordinary experience.

We often notice the existence of more or less fixed ideas in other people's minds — ideas with which they think without being aware of doing so. We then call them prejudices, which is logically quite correct because they have merely seeped into the mind and are in no way the result of Judgement. But the word prejudice is generally applied to ideas that are patently erroneous.

Recognisable as such by anyone except the prejudiced man, most of the ideas with which we think are not of that kind at all. To some of them, like those incorporated in words and grammar, the notions of truth or error cannot even be applied, others are quite definitely not prejudices but the result of a Judgement; others again are tacit assumptions or presuppositions which may be very difficult to recognise.

I say, therefore, that we think with or through ideas and that what we call thinking is generally the application of preexisting ideas to a given situation or set of facts. When we think about, say the political situation, we apply to that situation our political ideas, more or less systematically, and attempt to make the situation 'intelligible' to ourselves by means of these ideas. Similarly everywhere else. Some of the ideas are ideas of value, that is to say, we evaluate the situation in the light of our value-ideas.

The way in which we experience and interpret the world obviously depends very much indeed on kind of ideas that fill our minds. If they are mainly small, weak, superficial, and incoherent, life will appear insipid, uninteresting, petty and chaotic. It is difficult to bear the resultant feeling of emptiness, and the vacuum of our minds may only too easily be filled by some big, fantastic notion - political or otherwise -which suddenly seem to illumine everything and to give meaning and purpose to our existence. It needs no emphasis that herein lies one of tile great danger of our time.

When people ask for education they normally mean something more than mere training, something more than mere knowledge of facts, and something more than a mere diversion. May be they cannot themselves formulate precisely what they are looking for; but I think what they are really looking for is ideas that could make the world, and their own lives, intelligible to them. When a thing is intelligible you have a sense of participation; when a thing is unintelligible you have a sense of estrangement. 'Well, I don't know,' you hear people say, as an impotent protest against the unintelligibility of the world as they meet it. If the mind cannot bring to the world a set - or, shall we say, a tool-box - of powerful ideas, the world must appear to it as a chaos, a mass of unrelated phenomena, of meaningless events. Such a man is like a person in a strange land without any meaning to him; nothing can hold his vital interest; he has no means of making anything intelligible to himself.

The author's assertion in the passage is that the main responsibility of education is to:

A. transmit ideas of value.
B. transmit technical knowledge.
C. both *a* and *b*
D. transmit values regarding human and societal norms

**5.2.167 English Language: CAT 1998 | Question: 115** top

Read the following passages and answer the questions based on each.

If western civilisation is in a state of permanent crisis, it is not far fetched to suggest that there may be something wrong with its education. No civilisation, I am sure, has ever devoted more energy and resources to organised education, and if we believe in nothing else, we certainly believe that education is, or should he, the key to everything In fact, the belief in education is so strong that we treat it as the residual legatee of all our problems. If the nuclear age brings new danger; if the advance of genetic engineering opens the doors to new abuses; if commercialism brings new temptations; the answer must be more and better education. The modern way of life is becoming ever more complex: this means that everybody must become more highly educated. 'By 1984', it was said recently, 'it will be desirable that the most ordinary of men is not embarrassed by the use of a logarithm table, the elementary concepts of the calculus, and by the definitions and uses of such words as electron, coulomb, and volt. He should further have become able not only to handle a pen, pencil, and ruler but also a magnetic tape, valve, and transistor. The improvement of communications between individuals and groups depends on it.' Most of all, it appears, the international situation calls for prodigious educational efforts. The classical statement on this point was delivered by Sir Charles Snow in his 'Rede Lecture' some years ago: To say that we must educate ourselves or perish, is a little more melodramatic than the facts warrant. To say we have to educate ourselves or watch a steep decline in our lifetime, is about right, According to Lord Snow, the Russians are apparently doing much better than anyone else and will 'have a clear edge', 'unless and until the Americans and we educate ourselves both sensibly and imaginatively'.

Lord Snow it will he recalled, talked about 'The Two Cultures and the Scientific Revolution' and expressed his concern that 'the intellectual life of the whole of western society is increasingly being split into two polar groups ..... at one pole we have the literary intellectuals ….. at the other, the Scientists.' He deplores the 'gulf of mutual incomprehension' between these two groups and wants it bridged. It is quite clear how he thinks this bridging' operation is to be done: the aims of his educational policy would be. first, to get as many 'alpha-plus scientists as the country can throw up", second, to train 'a much larger stratum of alpha professionals' to do the supporting research, high class design and development; third, to train 'thousands upon thousands' of other scientists and engineers; and finally, to train 'politicians, administrators and the entire community, who know enough science to have a sense of what the scientists are talking about'. If this fourth and last group can at least be educated enough to 'have sense' of what the real people. the scientists and engineers, are talking about, so Lord Snow seems to suggest, the gulf of mutual incomprehension between the 'Two Cultures' may be bridged.

These ideas on education, which are by no means unrepresentative of our times, leave one within the uncomfortable feeling that ordinary people, including politicians, administrators, and so forth, are really not much use; they have failed to make the grade: but, at least, they should be educated enough to have a sense of what is going on, and to know what the scientists mean when they talk, to quote Lord Snow's example about the Second Law of Thermodynamics. It is an uncomfortable feeling, because the scientists never tire of telling us that the fruits of their labours are 'neutral': whether they enrich humanity or destroy it depends on how they are used. And who is to decide how they are used? There is nothing in the training of scientists and engineers to enable them to take such decisions, or else, what becomes of the neutrality of science?

If so much reliance is today being placed in the power of education to enable ordinary people to cope with the problems thrown up by scientific and technological progress, then there must be something more to education than Lord Snow suggests. Science and engineering produce 'know-how'; is one more a culture than a piano is music, can education help us to finish the sentence, to turn the potentiality into a reality to the benefit of man?

To do so, the task of education would be, first and foremost, the transmission of ideas of value of what to do with our lives. There is no doubt also the need to transmit know-how but this must take second place, for it is obviously somewhat foolhardy to put great powers into the hands of people without making sure that they have a reasonable idea of what to do with them. At present, there can be little doubt that the whole of mankind is in mortal danger, not because we are short of scientific and technological know-how, but because we tend to use it destructively, without wisdom. More education can help us only if it produces more wisdom.

The essence of education, I suggest, is the transmission of values, but values do not help us to pick our way through life unless they have become our own, a part, so to say, of our mental make-up. This means that they are more than mere formulae or dogmatic assertions: that we think and feel with them, that they are the very instruments through which we like at interpret, and experience the world. When we think, we do not just think: we think with ideas. Our mind is not a blank, a tabula rasa. When we begin to think we can do so only because our mind is already filled with all sorts of ideas with which to think. All through our youth and adolescence, before the conscious and critical mind begins to act as a sort of censor and guardian at the threshold, ideas seep into our mind, vast hosts and multitudes of them. These years are, one might say, our Dark Ages during which we are nothing but inheritors; it is only in later years that we can gradually learn to sort out our inheritance.

First of all, there is language. Each word is an idea. If the language which seeps into us during our Dark Ages is English, our mind is thereby furnished by a set of ideas which is significantly different from the set represented by Chinese, Russian, German, or even American. Next to word, there are the rules of putting them together: grammar, another bundle of ideas, the study of which has fascinated some modern philosophers to such an extent that they thought they could reduce the whole of philosophy to a study of grammar.

All philosophers and others have always paid a great deal of attention to ideas seen as the result of thought and observation; but in modern times all too little attention has been paid to the study of the ideas which form the very instruments by which thought and observation proceed. On the basis of experience and conscious thought, small ideas may easily be dislodged, but when it comes to bigger, more universal, or more subtle ideas it may not be so easy to change them. Indeed, it is often difficult to become aware of them, as they are the instruments and not the results of our thinking, just as you can see what is outside you, but cannot easily see that with which you see, the eye itself. And even when one has become aware, it is often impossible

to judge them on the basis on ordinary experience.

We often notice the existence of more or less fixed ideas in other people's minds — ideas with which they think without being aware of doing so. We then call them prejudices, which is logically quite correct because they have merely seeped into the mind and are in no way the result of Judgement. But the word prejudice is generally applied to ideas that are patently erroneous.

Recognisable as such by anyone except the prejudiced man, most of the ideas with which we think are not of that kind at all. To some of them, like those incorporated in words and grammar, the notions of truth or error cannot even be applied, others are quite definitely not prejudices but the result of a Judgement; others again are tacit assumptions or presuppositions which may be very difficult to recognise.

I say, therefore, that we think with or through ideas and that what we call thinking is generally the application of preexisting ideas to a given situation or set of facts. When we think about, say the political situation, we apply to that situation our political ideas, more or less systematically, and attempt to make the situation 'intelligible' to ourselves by means of these ideas. Similarly everywhere else. Some of the ideas are ideas of value, that is to say, we evaluate the situation in the light of our value-ideas.

The way in which we experience and interpret the world obviously depends very much indeed on kind of ideas that fill our minds. If they are mainly small, weak, superficial, and incoherent, life will appear insipid, uninteresting, petty and chaotic. It is difficult to bear the resultant feeling of emptiness, and the vacuum of our minds may only too easily be filled by some big, fantastic notion - political or otherwise -which suddenly seem to illumine everything and to give meaning and purpose to our existence. It needs no emphasis that herein lies one of tile great danger of our time.

When people ask for education they normally mean something more than mere training, something more than mere knowledge of facts, and something more than a mere diversion. May be they cannot themselves formulate precisely what they are looking for; but I think what they are really looking for is ideas that could make the world, and their own lives, intelligible to them. When a thing is intelligible you have a sense of participation; when a thing is unintelligible you have a sense of estrangement. 'Well, I don't know,' you hear people say, as an impotent protest against the unintelligibility of the world as they meet it. If the mind cannot bring to the world a set - or, shall we say, a tool-box - of powerful ideas, the world must appear to it as a chaos, a mass of unrelated phenomena, of meaningless events. Such a man is like a person in a strange land without any meaning to him; nothing can hold his vital interest; he has no means of making anything intelligible to himself.

The author believes that:

A. the gulf between science and literature needs to be bridged.
B. the gulf between science and literature should be maintained for a holistic view of society and its problems.
C. the gulf between science and literature is created by society.
D. none of the above.

## 5.2.168 English Language: CAT 1998 | Question: 116 top

Read the following passages and answer the questions based on each.

If western civilisation is in a state of permanent crisis, it is not far fetched to suggest that there may be something wrong with its education. No civilisation, I am sure, has ever devoted more energy and resources to organised education, and if we believe in nothing else, we certainly believe that education is, or should he, the key to everything In fact, the belief in education is so strong that we treat it as the residual legatee of all our problems. If the nuclear age brings new danger; if the advance of genetic engineering opens the doors to new abuses; if commercialism brings new temptations; the answer must be more and better education. The modern way of life is becoming ever more complex: this means that everybody must become more highly educated. 'By 1984', it was said recently, 'it will be desirable that the most ordinary of men is not embarrassed by the use of a logarithm table, the elementary concepts of the calculus, and by the definitions and uses of such words as electron, coulomb, and volt. He should further have become able not only to handle a pen, pencil, and ruler but also a magnetic tape, valve, and transistor. The improvement of communications between individuals and groups depends on it.' Most of all, it appears, the international situation calls for prodigious educational efforts. The classical statement on this point was delivered by Sir Charles Snow in his 'Rede Lecture' some years ago: To say that we must educate ourselves or perish, is a little more melodramatic than the facts warrant. To say we have to educate ourselves or watch a steep decline in our lifetime, is about right, According to Lord Snow, the Russians are apparently doing much better than anyone else and will 'have a clear edge', 'unless and until the Americans and we educate ourselves both sensibly and imaginatively'.

Lord Snow it will he recalled, talked about 'The Two Cultures and the Scientific Revolution' and expressed his concern that 'the intellectual life of the whole of western society is increasingly being split into two polar groups ..... at one pole we have the literary intellectuals ….. at the other, the Scientists.' He deplores the 'gulf of mutual incomprehension' between these two groups and wants it bridged. It is quite clear how he thinks this bridging' operation is to be done: the aims of his educational policy would be. first, to get as many 'alpha-plus scientists as the country can throw up", second, to train 'a much larger stratum of alpha professionals' to do the supporting research, high class design and development; third, to train 'thousands upon thousands' of other scientists and engineers; and finally, to train 'politicians, administrators and the entire community,

who know enough science to have a sense of what the scientists are talking about'. If this fourth and last group can at least be educated enough to ‘have sense’ of what the real people. the scientists and engineers, are talking about, so Lord Snow seems to suggest, the gulf of mutual incomprehension between the 'Two Cultures' may be bridged.

These ideas on education, which are by no means unrepresentative of our times, leave one within the uncomfortable feeling that ordinary people, including politicians, administrators, and so forth, are really not much use; they have failed to make the grade: but, at least, they should be educated enough to have a sense of what is going on, and to know what the scientists mean when they talk, to quote Lord Snow’s example about the Second Law of Thermodynamics. It is an uncomfortable feeling, because the scientists never tire of telling us that the fruits of their labours are ‘neutral’: whether they enrich humanity or destroy it depends on how they are used. And who is to decide how they are used? There is nothing in the training of scientists and engineers to enable them to take such decisions, or else, what becomes of the neutrality of science?

If so much reliance is today being placed in the power of education to enable ordinary people to cope with the problems thrown up by scientific and technological progress, then there must be something more to education than Lord Snow suggests. Science and engineering produce ‘know-how’; is one more a culture than a piano is music, can education help us to finish the sentence, to turn the potentiality into a reality to the benefit of man?

To do so, the task of education would be, first and foremost, the transmission of ideas of value of what to do with our lives. There is no doubt also the need to transmit know-how but this must take second place, for it is obviously somewhat foolhardy to put great powers into the hands of people without making sure that they have a reasonable idea of what to do with them. At present, there can be little doubt that the whole of mankind is in mortal danger, not because we are short of scientific and technological know-how, but because we tend to use it destructively, without wisdom. More education can help us only if it produces more wisdom.

The essence of education, I suggest, is the transmission of values, but values do not help us to pick our way through life unless they have become our own, a part, so to say, of our mental make-up. This means that they are more than mere formulae or dogmatic assertions: that we think and feel with them, that they are the very instruments through which we like at interpret, and experience the world. When we think, we do not just think: we think with ideas. Our mind is not a blank, a tabula rasa. When we begin to think we can do so only because our mind is already filled with all sorts of ideas with which to think. All through our youth and adolescence, before the conscious and critical mind begins to act as a sort of censor and guardian at the threshold, ideas seep into our mind, vast hosts and multitudes of them. These years are, one might say, our Dark Ages during which we are nothing but inheritors; it is only in later years that we can gradually learn to sort out our inheritance.

First of all, there is language. Each word is an idea. If the language which seeps into us during our Dark Ages is English, our mind is thereby furnished by a set of ideas which is significantly different from the set represented by Chinese, Russian, German, or even American. Next to word, there are the rules of putting them together: grammar, another bundle of ideas, the study of which has fascinated some modern philosophers to such an extent that they thought they could reduce the whole of philosophy to a study of grammar.

All philosophers and others have always paid a great deal of attention to ideas seen as the result of thought and observation; but in modern times all too little attention has been paid to the study of the ideas which form the very instruments by which thought and observation proceed. On the basis of experience and conscious thought, small ideas may easily be dislodged, but when it comes to bigger, more universal, or more subtle ideas it may not be so easy to change them. Indeed, it is often difficult to become aware of them, as they are the instruments and not the results of our thinking, just as you can see what is outside you, but cannot easily see that with which you see, the eye itself. And even when one has become aware, it is often impossible to judge them on the basis on ordinary experience.

We often notice the existence of more or less fixed ideas in other people’s minds — ideas with which they think without being aware of doing so. We then call them prejudices, which is logically quite correct because they have merely seeped into the mind and are in no way the result of Judgement. But the word prejudice is generally applied to ideas that are patently erroneous.

Recognisable as such by anyone except the prejudiced man, most of the ideas with which we think are not of that kind at all. To some of them, like those incorporated in words and grammar, the notions of truth or error cannot even be applied, others are quite definitely not prejudices but the result of a Judgement; others again are tacit assumptions or presuppositions which may be very difficult to recognise.

I say, therefore, that we think with or through ideas and that what we call thinking is generally the application of preexisting ideas to a given situation or set of facts. When we think about, say the political situation, we apply to that situation our political ideas, more or less systematically, and attempt to make the situation 'intelligible' to ourselves by means of these ideas. Similarly everywhere else. Some of the ideas are ideas of value, that is to say, we evaluate the situation in the light of our value-ideas.

The way in which we experience and interpret the world obviously depends very much indeed on kind of ideas that fill our minds. If they are mainly small, weak, superficial, and incoherent, life will appear insipid, uninteresting, petty and chaotic. It is difficult to bear the resultant feeling of emptiness, and the vacuum of our minds may only too easily be filled by some big, fantastic notion - political or otherwise -which suddenly seem to illumine everything and to give meaning and purpose to our existence. It needs no emphasis that herein lies one of tile great danger of our time.

When people ask for education they normally mean something more than mere training, something more than mere knowledge of facts, and something more than a mere diversion. May be they cannot themselves formulate precisely what they are looking for; but I think what they are really looking for is ideas that could make the world, and their own lives, intelligible to them.

When a thing is intelligible you have a sense of participation; when a thing is unintelligible you have a sense of estrangement. 'Well, I don't know,' you hear people say, as an impotent protest against the unintelligibility of the world as they meet it. If the mind cannot bring to the world a set - or, shall we say, a tool-box - of powerful ideas, the world must appear to it as a chaos, a mass of unrelated phenomena, of meaningless events. Such a man is like a person in a strange land without any meaning to him; nothing can hold his vital interest; he has no means of making anything intelligible to himself.

Which of the following sentences is not true according to the author?

A. values must be part of one's psyche.
B. values are merely dogmatic assertions.
C. one identifies with values.
D. values are the means to interpret and experience the word.

'By 1984', it was said recently, 'it will be desirable that the most ordinary of men is not embarrassed by the use of a logarithm table, the elementary concepts of the calculus, and by the definitions and uses of such words as electron, coulomb, and volt. He should further have become able not only to handle a pen, pencil, and ruler but also a magnetic tape, valve, and transistor. The improvement of communications between individuals and groups depends on it.' Most of all, it appears, the international situation calls for prodigious educational efforts. The classical statement on this point was delivered by Sir Charles Snow in his 'Rede Lecture' some years ago: To say that we must educate ourselves or perish, is a little more melodramatic than the facts warrant. To say we have to educate ourselves or watch a steep decline in our lifetime, is about right, According to Lord Snow, the Russians are apparently doing much better than anyone else and will 'have a clear edge', 'unless and until the Americans and we educate ourselves both sensibly and imaginatively'.

Lord Snow it will he recalled, talked about 'The Two Cultures and the Scientific Revolution' and expressed his concern that 'the intellectual life of the whole of western society is increasingly being split into two polar groups ..... at one pole we have the literary intellectuals ….. at the other, the Scientists.' He deplores the 'gulf of mutual incomprehension' between these two groups and wants it bridged. It is quite clear how he thinks this bridging' operation is to be done: the aims of his educational policy would be. first, to get as many 'alpha-plus scientists as the country can throw up", second, to train 'a much larger stratum of alpha professionals' to do the supporting research, high class design and development; third, to train 'thousands upon thousands' of other scientists and engineers; and finally, to train 'politicians, administrators and the entire community, who know enough science to have a sense of what the scientists are talking about'. If this fourth and last group can at least be educated enough to 'have sense' of what the real people. the scientists and engineers, are talking about, so Lord Snow seems to suggest, the gulf of mutual incomprehension between the 'Two Cultures' may be bridged.

These ideas on education, which are by no means unrepresentative of our times, leave one within the uncomfortable feeling that ordinary people, including politicians, administrators, and so forth, are really not much use; they have failed to make the grade: but, at least, they should be educated enough to have a sense of what is going on, and to know what the scientists mean when they talk, to quote Lord Snow's example about the Second Law of Thermodynamics. It is an uncomfortable feeling, because the scientists never tire of telling us that the fruits of their labours are 'neutral': whether they enrich humanity or destroy it depends on how they are used. And who is to decide how they are used? There is nothing in the training of scientists and engineers to enable them to take such decisions, or else, what becomes of the neutrality of science?

If so much reliance is today being placed in the power of education to enable ordinary people to cope with the problems thrown up by scientific and technological progress, then there must be something more to education than Lord Snow suggests. Science and engineering produce 'know-how'; is one more a culture than a piano is music, can education help us to finish the sentence, to turn the potentiality into a reality to the benefit of man?

To do so, the task of education would be, first and foremost, the transmission of ideas of value of what to do with our lives. There is no doubt also the need to transmit know-how but this must take second place, for it is obviously somewhat foolhardy to put great powers into the hands of people without making sure that they have a reasonable idea of what to do with them. At present, there can be little doubt that the whole of mankind is in mortal danger, not because we are short of scientific and technological know-how, but because we tend to use it destructively, without wisdom. More education can help us only if it produces more wisdom.

The essence of education, I suggest, is the transmission of values, but values do not help us to pick our way through life unless they have become our own, a part, so to say, of our mental make-up. This means that they are more than mere formulae or dogmatic assertions: that we think and feel with them, that they are the very instruments through which we like at interpret, and

experience the world. When we think, we do not just think: we think with ideas. Our mind is not a blank, a tabula rasa. When we begin to think we can do so only because our mind is already filled with all sorts of ideas with which to think. All through our youth and adolescence, before the conscious and critical mind begins to act as a sort of censor and guardian at the threshold, ideas seep into our mind, vast hosts and multitudes of them. These years are, one might say, our Dark Ages during which we are nothing but inheritors; it is only in later years that we can gradually learn to sort out our inheritance.

First of all, there is language. Each word is an idea. If the language which seeps into us during our Dark Ages is English, our mind is thereby furnished by a set of ideas which is significantly different from the set represented by Chinese, Russian, German, or even American. Next to word, there are the rules of putting them together: grammar, another bundle of ideas, the study of which has fascinated some modern philosophers to such an extent that they thought they could reduce the whole of philosophy to a study of grammar.

All philosophers and others have always paid a great deal of attention to ideas seen as the result of thought and observation; but in modern times all too little attention has been paid to the study of the ideas which form the very instruments by which thought and observation proceed. On the basis of experience and conscious thought, small ideas may easily be dislodged, but when it comes to bigger, more universal, or more subtle ideas it may not be so easy to change them. Indeed, it is often difficult to become aware of them, as they are the instruments and not the results of our thinking, just as you can see what is outside you, but cannot easily see that with which you see, the eye itself. And even when one has become aware, it is often impossible to judge them on the basis on ordinary experience.

We often notice the existence of more or less fixed ideas in other people's minds — ideas with which they think without being aware of doing so. We then call them prejudices, which is logically quite correct because they have merely seeped into the mind and are in no way the result of Judgement. But the word prejudice is generally applied to ideas that are patently erroneous.

Recognisable as such by anyone except the prejudiced man, most of the ideas with which we think are not of that kind at all. To some of them, like those incorporated in words and grammar, the notions of truth or error cannot even be applied, others are quite definitely not prejudices but the result of a Judgement; others again are tacit assumptions or presuppositions which may be very difficult to recognise.

I say, therefore, that we think with or through ideas and that what we call thinking is generally the application of preexisting ideas to a given situation or set of facts. When we think about, say the political situation, we apply to that situation our political ideas, more or less systematically, and attempt to make the situation 'intelligible' to ourselves by means of these ideas. Similarly everywhere else. Some of the ideas are ideas of value, that is to say, we evaluate the situation in the light of our value-ideas.

The way in which we experience and interpret the world obviously depends very much indeed on kind of ideas that fill our minds. If they are mainly small, weak, superficial, and incoherent, life will appear insipid, uninteresting, petty and chaotic. It is difficult to bear the resultant feeling of emptiness, and the vacuum of our minds may only too easily be filled by some big, fantastic notion - political or otherwise -which suddenly seem to illumine everything and to give meaning and purpose to our existence. It needs no emphasis that herein lies one of tile great danger of our time.

When people ask for education they normally mean something more than mere training, something more than mere knowledge of facts, and something more than a mere diversion. May be they cannot themselves formulate precisely what they are looking for; but I think what they are really looking for is ideas that could make the world, and their own lives, intelligible to them. When a thing is intelligible you have a sense of participation; when a thing is unintelligible you have a sense of estrangement. 'Well, I don't know,' you hear people say, as an impotent protest against the unintelligibility of the world as they meet it. If the mind cannot bring to the world a set - or, shall we say, a tool-box - of powerful ideas, the world must appear to it as a chaos, a mass of unrelated phenomena, of meaningless events. Such a man is like a person in a strange land without any meaning to him; nothing can hold his vital interest; he has no means of making anything intelligible to himself.

Thinking is

A. being
B. knowing
C. application of pre-existing ideas to a situation.
D. application of fixed ideas to a situation.

## 5.2.170 English Language: CAT 1998 | Question: 118 top

Read the following passages and answer the questions based on each.

We have moved from the old organised model to today's unorganised one. In the orderly, stable organised world, there was certainty and convention. In the global unorganised world, there is freedom, diversity and instability. While these changes have occurred in the wider world, managers and employees have not changed their attitude and behaviour sufficiently to adapt their traditional business organisations to the new circumstances. As a result, much of the activity that takes place in our organisations is mere business and not business. In other words, it is bureaucracy, administration and other non- value adding work.

Today typical business organisations hove formal membership and highly structured policies and procedures, with work carried out in specified locations such as offices. These organised business organisations suffer from some fundamental flaws that cause the high levels of bureaucracy and busyness. The fundamental flaws are: Increasingly Bounded Rationality, Lack of

Incentive, Existence of Force.

Bounded rationality is the problem of limited understanding and control of an increasingly dynamic and global unorganised world. Managers cannot locate and organise responses to opportunities and threats around the globe. They must respond by devolving decision-making responsibility, letting strategies emerge and making reversible commitments. If they do not, their inability to realize the organisation's full potential will cause discontent amongst employees, customers and shareholders.

Accurate incentives within free markets stimulate the optimal completion of valuable business outcomes, paramount amongst which is excellent customer service. However, bounded rationality causes a lack of accurate and adequate incentives within traditional static companies. These faulty incentives mean that achieving' world class performance is reliant upon the existence of intrinsic employee motivations such as pride and satisfaction felt at delighting a customer. Faulty incentives also necessitate the very existence of managers and managerial procedures. If everyone in the company was doing what they wanted to, there would be no need for other people higher in rank to supervise and ensure adequate completions of the tasks.

Dependence within organised organisations means that to perform excellently, individuals have to rely on their colleagues supporting them. Organised groupings such as teams splinter and divide because different members think and believe different things about the decisions going on within that group. Effort is either expended on busy negotiations and compromise to keep the group together, or the static group disintegrates. Either way, the organised groupings do not provide an optimal platform for internal employee collaboration or external customer responsiveness.

The existence of coercion and force within organised business organisations means that people are forced to do things. They have no choice but to carry out the tasks given to them by their managers, which they are often not interested in or suited to, or which do not challenge their full abilities. This means that employee potential is not maximised and external customer results are sub-optimal

To overcome these fundamental flaws and ensure that the company's actual growth is close to its sustainable potential, managers should implement unorganisation techniques such as down-structuring, opportunitizing and collapsible corporation. This then aligns their companies more closely to the unorganised. operating environment and thereby increases the amount of business and reduces the amount of busyness carried out in organisational contexts.

Down-structuring (removing structure) is not about reducing the number of employees (down sizing) or changing structure (restructuring). Down-structuring is removing the "hard" side of the organisation: its policies, procedures, strategies systems and structures such as job titles and paper-based administration. Down-structuring is the technique of choice for transforming those areas of organisation involved in idea creation and knowledge working. Because idea creation is not related to time or place, downstructuring is a useful tool that facilitates location independent working. Currently in India, many workers travel to their company offices to work because they do not have the necessary resources at home. But as mobile and fixed telecommunications services and Internet provision are deregulated, such services will fall in price and become widely available to more people.

Whereas down-structuring is the practice of eliminating structure, opportunitizing is the practice of making structures in the organisation dynamic. Opportunitizing is best suited to freeing employees engaged in physical activities such as farming, distribution, manufacturing and assembly. Within such industries, employees should be able to take responsibility for important personal and company objectives such as product quality, customer service, reliable production, continuous improvement and learning. Opportunitizing reduces structure sufficiently to allow employees to meet these valuable and objectives by minimising the means that hinder their achievement. Too many procedures were set up merely with the intention of arbitrary control of "subordinates".

Under opportunitizing, those structures that are static and an end in themselves (a means for managerial control) are removed, On the other hand, those structures that are dynamic and flexible and a means to an end (employee learning, product quality) are kept. The remaining positive procedures are opportunitized, such that they are followed during routine customer services requests. Down-structured companies and new start-ups will be collapsible dynamically and impermanently in order to meet customer requirements.

The people who participate in collapsible corporations will have transformed themselves from dependent "rankers"; interchangeable units of economic production, to independent "branders": people who think of themselves as brands, with a strong inner care of knowledge and outer care of image and networking. Collapsible corporations are shaped around electronic signals rather than physical geographical office buildings.

Business success for collapsible corporations is all about combining the complementary capabilities of business partners for mutual gain. Once a novel idea or content has been generated, it can be implemented by outsourcing the actual production and distribution. Enabling technologies such as the Internet facilitate this partnering. Such low-entry barrier media provide entrepreneurs with a mechanism to create wealth. Like unorganisation, core competence advocates specialisation and outsourcing of all activities that are not directly related to the core competence.

It can be said that dependence contributes to busyness most likely through:

A. Wastage of energy and effort in keeping groups together through negotiations and compromises.
B. Wastage of time in getting people to do the job.
C. Wastage of effort in trying to group people and educate them.
D. None of the above.

## 5.2.171 English Language: CAT 1998 | Question: 119 top

Read the following passages and answer the questions based on each.

We have moved from the old organised model to today's unorganised one. In the orderly, stable organised world, there was certainty and convention. In the global unorganised world, there is freedom, diversity and instability. While these changes have occurred in the wider world, managers and employees have not changed their attitude and behaviour sufficiently to adapt their traditional business organisations to the new circumstances. As a result, much of the activity that takes place in our organisations is mere business and not business. In other words, it is bureaucracy, administration and other non- value adding work.

Today typical business organisations hove formal membership and highly structured policies and procedures, with work carried out in specified locations such as offices. These organised business organisations suffer from some fundamental flaws that cause the high levels of bureaucracy and busyness. The fundamental flaws are: Increasingly Bounded Rationality, Lack of Incentive, Existence of Force.

Bounded rationality is the problem of limited understanding and control of an increasingly dynamic and global unorganised world. Managers cannot locate and organise responses to opportunities and threats around the globe. They must respond by devolving decision-making responsibility, letting strategies emerge and making reversible commitments. If they do not, their inability to realize the organisation's full potential will cause discontent amongst employees, customers and shareholders.

Accurate incentives within free markets stimulate the optimal completion of valuable business outcomes, paramount amongst which is excellent customer service. However, bounded rationality causes a lack of accurate and adequate incentives within traditional static companies. These faulty incentives mean that achieving' world class performance is reliant upon the existence of intrinsic employee motivations such as pride and satisfaction felt at delighting a customer. Faulty incentives also necessitate the very existence of managers and managerial procedures. If everyone in the company was doing what they wanted to, there would be no need for other people higher in rank to supervise and ensure adequate completions of the tasks.

Dependence within organised organisations means that to perform excellently, individuals have to rely on their colleagues supporting them. Organised groupings such as teams splinter and divide because different members think and believe different things about the decisions going on within that group. Effort is either expended on busy negotiations and compromise to keep the group together, or the static group disintegrates. Either way, the organised groupings do not provide an optimal platform for internal employee collaboration or external customer responsiveness.

The existence of coercion and force within organised business organisations means that people are forced to do things. They have no choice but to carry out the tasks given to them by their managers, which they are often not interested in or suited to, or which do not challenge their full abilities. This means that employee potential is not maximised and external customer results are sub-optimal

To overcome these fundamental flaws and ensure that the company's actual growth is close to its sustainable potential, managers should implement unorganisation techniques such as down-structuring, opportunitizing and collapsible corporation. This then aligns their companies more closely to the unorganised. operating environment and thereby increases the amount of business and reduces the amount of busyness carried out in organisational contexts.

Down-structuring (removing structure) is not about reducing the number of employees (down sizing) or changing structure (restructuring). Down-structuring is removing the "hard" side of the organisation: its policies, procedures, strategies systems and structures such as job titles and paper-based administration. Down-structuring is the technique of choice for transforming those areas of organisation involved in idea creation and knowledge working. Because idea creation is not related to time or place, downstructuring is a useful tool that facilitates location independent working. Currently in India, many workers travel to their company offices to work because they do not have the necessary resources at home. But as mobile and fixed telecommunications services and Internet provision are deregulated, such services will fall in price and become widely available to more people.

Whereas down-structuring is the practice of eliminating structure, opportunitizing is the practice of making structures in the organisation dynamic. Opportunitizing is best suited to freeing employees engaged in physical activities such as farming, distribution, manufacturing and assembly. Within such industries, employees should be able to take responsibility for important personal and company objectives such as product quality, customer service, reliable production, continuous improvement and learning. Opportunitizing reduces structure sufficiently to allow employees to meet these valuable and objectives by minimising the means that hinder their achievement. Too many procedures were set up merely with the intention of arbitrary control of "subordinates".

Under opportunitizing, those structures that are static and an end in themselves (a means for managerial control) are removed, On the other hand, those structures that are dynamic and flexible and a means to an end (employee learning, product quality) are kept. The remaining positive procedures are opportunitized, such that they are followed during routine customer services requests. Down-structured companies and new start-ups will be collapsible dynamically and impermanently in order to meet customer requirements.

The people who participate in collapsible corporations will have transformed themselves from dependent "rankers"; interchangeable units of economic production, to independent "branders": people who think of themselves as brands, with a strong inner care of knowledge and outer care of image and networking. Collapsible corporations are shaped around electronic

signals rather than physical geographical office buildings.

Business success for collapsible corporations is all about combining the complementary capabilities of business partners for mutual gain. Once a novel idea or content has been generated, it can be implemented by outsourcing the actual production and distribution. Enabling technologies such as the Internet facilitate this partnering. Such low-entry barrier media provide entrepreneurs with a mechanism to create wealth. Like unorganisation, core competence advocates specialisation and outsourcing of all activities that are not directly related to the core competence.

Which of the following can be least true of the characteristic of "Down-Structuring"?

A. Reduction in employee numbers in order to cut down the cost.
B. Changing structure in order to satisfy the customer.
C. Realigning organisational adjectives in order
D. maximise the profit.
E. All of the above except (b)

## 5.2.173 English Language: CAT 1998 | Question: 120 top

Read the following passages and answer the questions based on each.

We have moved from the old organised model to today's unorganised one. In the orderly, stable organised world, there was certainty and convention. In the global unorganised world, there is freedom, diversity and instability. While these changes have occurred in the wider world, managers and employees have not changed their attitude and behaviour sufficiently to adapt their traditional business organisations to the new circumstances. As a result, much of the activity that takes place in our organisations is mere business and not business. In other words, it is bureaucracy, administration and other non- value adding work.

Today typical business organisations hove formal membership and highly structured policies and procedures, with work carried out in specified locations such as offices. These organised business organisations suffer from some fundamental flaws that cause the high levels of bureaucracy and busyness. The fundamental flaws are: Increasingly Bounded Rationality, Lack of Incentive, Existence of Force.

Bounded rationality is the problem of limited understanding and control of an increasingly dynamic and global unorganised world. Managers cannot locate and organise responses to opportunities and threats around the globe. They must respond by devolving decision-making responsibility, letting strategies emerge and making reversible commitments. If they do not, their inability to realize the organisation's full potential will cause discontent amongst employees, customers and shareholders.

Accurate incentives within free markets stimulate the optimal completion of valuable business outcomes, paramount amongst which is excellent customer service. However, bounded rationality causes a lack of accurate and adequate incentives within traditional static companies. These faulty incentives mean that achieving' world class performance is reliant upon the existence of intrinsic employee motivations such as pride and satisfaction felt at delighting a customer. Faulty incentives also necessitate the very existence of managers and managerial procedures. If everyone in the company was doing what they wanted to, there would be no need for other people higher in rank to supervise and ensure adequate completions of the tasks.

Dependence within organised organisations means that to perform excellently, individuals have to rely on their colleagues supporting them. Organised groupings such as teams splinter and divide because different members think and believe different things about the decisions going on within that group. Effort is either expended on busy negotiations and compromise to keep the group together, or the static group disintegrates. Either way, the organised groupings do not provide an optimal platform for internal employee collaboration or external customer responsiveness.

The existence of coercion and force within organised business organisations means that people are forced to do things. They have no choice but to carry out the tasks given to them by their managers, which they are often not interested in or suited to, or which do not challenge their full abilities. This means that employee potential is not maximised and external customer results are sub-optimal

To overcome these fundamental flaws and ensure that the company's actual growth is close to its sustainable potential,

managers should implement unorganisation techniques such as down-structuring, opportunitizing and collapsible corporation. This then aligns their companies more closely to the unorganised. operating environment and thereby increases the amount of business and reduces the amount of busyness carried out in organisational contexts.

Down-structuring (removing structure) is not about reducing the number of employees (down sizing) or changing structure (restructuring). Down-structuring is removing the "hard" side of the organisation: its policies, procedures, strategies systems and structures such as job titles and paper-based administration. Down-structuring is the technique of choice for transforming those areas of organisation involved in idea creation and knowledge working. Because idea creation is not related to time or place, downstructuring is a useful tool that facilitates location independent working. Currently in India, many workers travel to their company offices to work because they do not have the necessary resources at home. But as mobile and fixed telecommunications services and Internet provision are deregulated, such services will fall in price and become widely available to more people.

Whereas down-structuring is the practice of eliminating structure, opportunitizing is the practice of making structures in the organisation dynamic. Opportunitizing is best suited to freeing employees engaged in physical activities such as farming, distribution, manufacturing and assembly. Within such industries, employees should be able to take responsibility for important personal and company objectives such as product quality, customer service, reliable production, continuous improvement and learning. Opportunitizing reduces structure sufficiently to allow employees to meet these valuable and objectives by minimising the means that hinder their achievement. Too many procedures were set up merely with the intention of arbitrary control of "subordinates".

Under opportunitizing, those structures that are static and an end in themselves (a means for managerial control) are removed, On the other hand, those structures that are dynamic and flexible and a means to an end (employee learning, product quality) are kept. The remaining positive procedures are opportunitized, such that they are followed during routine customer services requests. Down-structured companies and new start-ups will be collapsible dynamically and impermanently in order to meet customer requirements.

The people who participate in collapsible corporations will have transformed themselves from dependent "rankers"; interchangeable units of economic production, to independent "branders": people who think of themselves as brands, with a strong inner care of knowledge and outer care of image and networking. Collapsible corporations are shaped around electronic signals rather than physical geographical office buildings.

Business success for collapsible corporations is all about combining the complementary capabilities of business partners for mutual gain. Once a novel idea or content has been generated, it can be implemented by outsourcing the actual production and distribution. Enabling technologies such as the Internet facilitate this partnering. Such low-entry barrier media provide entrepreneurs with a mechanism to create wealth. Like unorganisation, core competence advocates specialisation and outsourcing of all activities that are not directly related to the core competence.

Which of the following is most likely to be true with regard to collapsible organisations?

A. People are “branders”.

B. People. would be outsourced by the organisation.

C. Antiquated methods of staffing would lose relevance.

D. All of the above

cat1998 english-language passage-reading

## 5.2.174 English Language: CAT 1998 | Question: 121 top

Read the following passages and answer the questions based on each.

We have moved from the old organised model to today’s unorganised one. In the orderly, stable organised world, there was certainty and convention. In the global unorganised world, there is freedom, diversity and instability. While these changes have occurred in the wider world, managers and employees have not changed their attitude and behaviour sufficiently to adapt their traditional business organisations to the new circumstances. As a result, much of the activity that takes place in our organisations is mere business and not business. In other words, it is bureaucracy, administration and other non- value adding work.

Today typical business organisations hove formal membership and highly structured policies and procedures, with work carried out in specified locations such as offices. These organised business organisations suffer from some fundamental flaws that cause the high levels of bureaucracy and busyness. The fundamental flaws are: Increasingly Bounded Rationality, Lack of Incentive, Existence of Force.

Bounded rationality is the problem of limited understanding and control of an increasingly dynamic and global unorganised world. Managers cannot locate and organise responses to opportunities and threats around the globe. They must respond by devolving decision-making responsibility, letting strategies emerge and making reversible commitments. If they do not, their inability to realize the organisation’s full potential will cause discontent amongst employees, customers and shareholders.

Accurate incentives within free markets stimulate the optimal completion of valuable business outcomes, paramount amongst which is excellent customer service. However, bounded rationality causes a lack of accurate and adequate incentives within traditional static companies. These faulty incentives mean that achieving’ world class performance is reliant upon the existence of intrinsic employee motivations such as pride and satisfaction felt at delighting a customer. Faulty incentives also necessitate the very existence of managers and managerial procedures. If everyone in the company was doing what they wanted to, there

would be no need for other people higher in rank to supervise and ensure adequate completions of the tasks.

Dependence within organised organisations means that to perform excellently, individuals have to rely on their colleagues supporting them. Organised groupings such as teams splinter and divide because different members think and believe different things about the decisions going on within that group. Effort is either expended on busy negotiations and compromise to keep the group together, or the static group disintegrates. Either way, the organised groupings do not provide an optimal platform for internal employee collaboration or external customer responsiveness.

The existence of coercion and force within organised business organisations means that people are forced to do things. They have no choice but to carry out the tasks given to them by their managers, which they are often not interested in or suited to, or which do not challenge their full abilities. This means that employee potential is not maximised and external customer results are sub-optimal

To overcome these fundamental flaws and ensure that the company's actual growth is close to its sustainable potential, managers should implement unorganisation techniques such as down-structuring, opportunitizing and collapsible corporation. This then aligns their companies more closely to the unorganised. operating environment and thereby increases the amount of business and reduces the amount of busyness carried out in organisational contexts.

Down-structuring (removing structure) is not about reducing the number of employees (down sizing) or changing structure (restructuring). Down-structuring is removing the "hard" side of the organisation: its policies, procedures, strategies systems and structures such as job titles and paper-based administration. Down-structuring is the technique of choice for transforming those areas of organisation involved in idea creation and knowledge working. Because idea creation is not related to time or place, downstructuring is a useful tool that facilitates location independent working. Currently in India, many workers travel to their company offices to work because they do not have the necessary resources at home. But as mobile and fixed telecommunications services and Internet provision are deregulated, such services will fall in price and become widely available to more people.

Whereas down-structuring is the practice of eliminating structure, opportunitizing is the practice of making structures in the organisation dynamic. Opportunitizing is best suited to freeing employees engaged in physical activities such as farming, distribution, manufacturing and assembly. Within such industries, employees should be able to take responsibility for important personal and company objectives such as product quality, customer service, reliable production, continuous improvement and learning. Opportunitizing reduces structure sufficiently to allow employees to meet these valuable and objectives by minimising the means that hinder their achievement. Too many procedures were set up merely with the intention of arbitrary control of "subordinates".

Under opportunitizing, those structures that are static and an end in themselves (a means for managerial control) are removed, On the other hand, those structures that are dynamic and flexible and a means to an end (employee learning, product quality) are kept. The remaining positive procedures are opportunitized, such that they are followed during routine customer services requests. Down-structured companies and new start-ups will be collapsible dynamically and impermanently in order to meet customer requirements.

The people who participate in collapsible corporations will have transformed themselves from dependent "rankers"; interchangeable units of economic production, to independent "branders": people who think of themselves as brands, with a strong inner care of knowledge and outer care of image and networking. Collapsible corporations are shaped around electronic signals rather than physical geographical office buildings.

Business success for collapsible corporations is all about combining the complementary capabilities of business partners for mutual gain. Once a novel idea or content has been generated, it can be implemented by outsourcing the actual production and distribution. Enabling technologies such as the Internet facilitate this partnering. Such low-entry barrier media provide entrepreneurs with a mechanism to create wealth. Like unorganisation, core competence advocates specialisation and outsourcing of all activities that are not directly related to the core competence.

Which of the following does not contribute to unwanted bureaucracy and busyness?

A. Bounded rationality not leading to decision making responsibility and commitments.
B. Lack of incentives leading to excessive need for support.
C. Dependence leading to excessive need for support.
D. Absence of force leading to non-maximization of potential.

cat1998 english-language passage-reading

## 5.2.175 English Language: CAT 1998 | Question: 122 top

Read the following passages and answer the questions based on each.

We have moved from the old organised model to today's unorganised one. In the orderly, stable organised world, there was certainty and convention. In the global unorganised world, there is freedom, diversity and instability. While these changes have occurred in the wider world, managers and employees have not changed their attitude and behaviour sufficiently to adapt their traditional business organisations to the new circumstances. As a result, much of the activity that takes place in our organisations is mere business and not business. In other words, it is bureaucracy, administration and other non- value adding work.

Today typical business organisations hove formal membership and highly structured policies and procedures, with work carried out in specified locations such as offices. These organised business organisations suffer from some fundamental flaws that cause the high levels of bureaucracy and busyness. The fundamental flaws are: Increasingly Bounded Rationality, Lack of Incentive, Existence of Force.

Bounded rationality is the problem of limited understanding and control of an increasingly dynamic and global unorganised world. Managers cannot locate and organise responses to opportunities and threats around the globe. They must respond by devolving decision-making responsibility, letting strategies emerge and making reversible commitments. If they do not, their inability to realize the organisation's full potential will cause discontent amongst employees, customers and shareholders.

Accurate incentives within free markets stimulate the optimal completion of valuable business outcomes, paramount amongst which is excellent customer service. However, bounded rationality causes a lack of accurate and adequate incentives within traditional static companies. These faulty incentives mean that achieving' world class performance is reliant upon the existence of intrinsic employee motivations such as pride and satisfaction felt at delighting a customer. Faulty incentives also necessitate the very existence of managers and managerial procedures. If everyone in the company was doing what they wanted to, there would be no need for other people higher in rank to supervise and ensure adequate completions of the tasks.

Dependence within organised organisations means that to perform excellently, individuals have to rely on their colleagues supporting them. Organised groupings such as teams splinter and divide because different members think and believe different things about the decisions going on within that group. Effort is either expended on busy negotiations and compromise to keep the group together, or the static group disintegrates. Either way, the organised groupings do not provide an optimal platform for internal employee collaboration or external customer responsiveness.

The existence of coercion and force within organised business organisations means that people are forced to do things. They have no choice but to carry out the tasks given to them by their managers, which they are often not interested in or suited to, or which do not challenge their full abilities. This means that employee potential is not maximised and external customer results are sub-optimal

To overcome these fundamental flaws and ensure that the company's actual growth is close to its sustainable potential, managers should implement unorganisation techniques such as down-structuring, opportunitizing and collapsible corporation. This then aligns their companies more closely to the unorganised. operating environment and thereby increases the amount of business and reduces the amount of busyness carried out in organisational contexts.

Down-structuring (removing structure) is not about reducing the number of employees (down sizing) or changing structure (restructuring). Down-structuring is removing the "hard" side of the organisation: its policies, procedures, strategies systems and structures such as job titles and paper-based administration. Down-structuring is the technique of choice for transforming those areas of organisation involved in idea creation and knowledge working. Because idea creation is not related to time or place, downstructuring is a useful tool that facilitates location independent working. Currently in India, many workers travel to their company offices to work because they do not have the necessary resources at home. But as mobile and fixed telecommunications services and Internet provision are deregulated, such services will fall in price and become widely available to more people.

Whereas down-structuring is the practice of eliminating structure, opportunitizing is the practice of making structures in the organisation dynamic. Opportunitizing is best suited to freeing employees engaged in physical activities such as farming, distribution, manufacturing and assembly. Within such industries, employees should be able to take responsibility for important personal and company objectives such as product quality, customer service, reliable production, continuous improvement and learning. Opportunitizing reduces structure sufficiently to allow employees to meet these valuable and objectives by minimising the means that hinder their achievement. Too many procedures were set up merely with the intention of arbitrary control of "subordinates".

Under opportunitizing, those structures that are static and an end in themselves (a means for managerial control) are removed, On the other hand, those structures that are dynamic and flexible and a means to an end (employee learning, product quality) are kept. The remaining positive procedures are opportunitized, such that they are followed during routine customer services requests. Down-structured companies and new start-ups will be collapsible dynamically and impermanently in order to meet customer requirements.

The people who participate in collapsible corporations will have transformed themselves from dependent "rankers"; interchangeable units of economic production, to independent "branders": people who think of themselves as brands, with a strong inner care of knowledge and outer care of image and networking. Collapsible corporations are shaped around electronic signals rather than physical geographical office buildings.

Business success for collapsible corporations is all about combining the complementary capabilities of business partners for mutual gain. Once a novel idea or content has been generated, it can be implemented by outsourcing the actual production and distribution. Enabling technologies such as the Internet facilitate this partnering. Such low-entry barrier media provide entrepreneurs with a mechanism to create wealth. Like unorganisation, core competence advocates specialisation and outsourcing of all activities that are not directly related to the core competence.

As per the passage, 'Bounded Rationality' may be defined as:

A. Limited understanding of a dynamic and changing world.
B. Irrationality in the wake of problems and the inability to cope with it.

C. Inability to comprehend simple things and the tendency to be complex in outlook.
D. None of the above.

## 5.2.176 English Language: CAT 1998 | Question: 123 top

Read the following passages and answer the questions based on each.

Over the last 20 years, the Bretton Woods institutions have disbursed loans for ‘stablisation” and “structural adjustment” to more than 70 development countries. These loans carry conditions that cover a wide range of domestic policies and institutions in borrower countries. The implementation of orthodox stabilisation and structural adjustment of programmes has been disastrous for the working people and the poor at the countries in which these programmes were imposed.

In the first 20 years of the IMF, over one-half of its resources were used by industrial countries. Over time, industrial countries stopped borrowing from the IMF, and it became a source of credit almost exclusively for developing countries. This process accelerated after the start of the debt crisis in 1982. There is now a clear division between borrowing and non-borrowing members of the Fund, a shift associated with a gradual phasing out of low conditionally loans. By 1981, financial assistance from the IMF was, in the words of an IMF publication, "conditioned on the adoption of adjustment lending". The new types of loans and the new environment of lending associated new conditions. IMF conditionalities now pertain not just to balance-of-payments or exchange rate and price policies, but to a large number of structural features of an economy. Conditionality has become more wider-ranging and more stringent now.

A similar development occurred with respect to lending by the World Bank. Until the mid- 1970s, the World Bank lent money primarily to finance development projects. The conditions imposed on the borrower related to performance in respect of specific projects. From the 1970s, however, the World Bank began non-project financing. In the early 1980s, the World Bank introduced Structural Adjustment Loans (SALS) and Sectorial Adjustment Loans (SECALs) lending has increased steadily.

This shift in the nature of lending was associated with a broadening of the conditions imposed on the borrower. The conditions attached to structural adjustment loans are economy-wide and include those on trade policy, public finance, the ownership and management of public sector enterprises and agricultural and industrial policy.

With the debt crises of the 1980s, and with both the IMF and the World Bank lending for stabilisation and structural adjustment, "cross-conditionality" came into force. The World Bank, for example, may not agree to a SAL unless the borrower country has accepted the terms of a standby agreement with the IMF. Together, the two Bretton Woods institutions are able to impose a host of conditions on the economies of developing countries. In what would have seemed a role- reversal in earlier years, the IMF can now impose conditions on specific sectors rather than on macroeconomic variables and the World Bank can impose conditions on macro- management rather than only on specific sectors and it is now difficult to distinguish between the conditionalities of the two institutions.

The need to study the effects of orthodox stabilisation and structural adjustment programmes comes from the fact that they have been implemented in large parts of developing world. The typical elements of an orthodox stabilisation and structural adjustment programme are first, fiscal austerity, monetary contraction and devaluation, and second, a set of policies at the sectoral and micro level. The second set of conditions focus on "reform" of "policies and institutions" and include privatising public sector enterprises, deregulating financial markets and agricultural prices, the labour market and removing trade barriers.

Orthodox stabilisation and structural adjustment programmes have been criticised, in India and elsewhere, on the three major grounds. The first is that they undermine the sovereignty of borrower nations. The second is that orthodox programmes have failed to stimulate social production and economic growth. The third is that these policies impose a severe burden on the poor.

Initially the role of the World Bank was to

A. Concentrate on non-project financing.
B. Dictating conditions which affected structural of economics.
C. Finance developmental projects.
D. Finance development projects and performance appraisal of those projects with respect to condition imposed.

## 5.2.180 English Language: CAT 1998 | Question: 127 top

Read the following passages and answer the questions based on each.

Over the last 20 years, the Bretton Woods institutions have disbursed loans for 'stablisation" and "structural adjustment" to more than 70 development countries. These loans carry conditions that cover a wide range of domestic policies and institutions in borrower countries. The implementation of orthodox stabilisation and structural adjustment of programmes has been disastrous for the working people and the poor at the countries in which these programmes were imposed.

In the first 20 years of the IMF, over one-half of its resources were used by industrial countries. Over time, industrial countries stopped borrowing from the IMF, and it became a source of credit almost exclusively for developing countries. This process accelerated after the start of the debt crisis in 1982. There is now a clear division between borrowing and non-borrowing members of the Fund, a shift associated with a gradual phasing out of low conditionally loans. By 1981, financial assistance from the IMF was, in the words of an IMF publication, "conditioned on the adoption of adjustment lending". The new types of loans and the new environment of lending associated new conditions. IMF conditionalities now pertain not just to balance-of-payments or exchange rate and price policies, but to a large number of structural features of an economy. Conditionality has become more wider-ranging and more stringent now.

A similar development occurred with respect to lending by the World Bank. Until the mid- 1970s, the World Bank lent money primarily to finance development projects. The conditions imposed on the borrower related to performance in respect of specific projects. From the 1970s, however, the World Bank began non-project financing. In the early 1980s, the World Bank introduced Structural Adjustment Loans (SALS) and Sectorial Adjustment Loans (SECALs) lending has increased steadily.

This shift in the nature of lending was associated with a broadening of the conditions imposed on the borrower. The conditions attached to structural adjustment loans are economy-wide and include those on trade policy, public finance, the ownership and management of public sector enterprises and agricultural and industrial policy.

With the debt crises of the 1980s, and with both the IMF and the World Bank lending for stabilisation and structural adjustment, "cross-conditionality" came into force. The World Bank, for example, may not agree to a SAL unless the borrower country has accepted the terms of a standby agreement with the IMF. Together, the two Bretton Woods institutions are able to impose a host of conditions on the economies of developing countries. In what would have seemed a role- reversal in earlier years, the IMF can now impose conditions on specific sectors rather than on macroeconomic variables and the World Bank can impose conditions on macro- management rather than only on specific sectors and it is now difficult to distinguish between the conditionalities of the two institutions.

The need to study the effects of orthodox stabilisation and structural adjustment programmes comes from the fact that they have been implemented in large parts of developing world. The typical elements of an orthodox stabilisation and structural adjustment programme are first, fiscal austerity, monetary contraction and devaluation, and second, a set of policies at the sectoral and micro level. The second set of conditions focus on "reform" of "policies and institutions" and include privatising public sector enterprises, deregulating financial markets and agricultural prices, the labour market and removing trade barriers.

Orthodox stabilisation and structural adjustment programmes have been criticised, in India and elsewhere, on the three major grounds. The first is that they undermine the sovereignty of borrower nations. The second is that orthodox programmes have failed to stimulate social production and economic growth. The third is that these policies impose a severe burden on the poor.

The trends in the IMF conditionalities:

A. Now point towards emphasis on balance of payments.
B. Now point towards emphasis on exchange rates.
C. Are tending towards affecting price policies of borrowers.
D. Now affect a large number of structural features of the economies of borrowing countries.

cat1998 english-language passage-reading

## 5.2.181 English Language: CAT 1998 | Question: 128 top

Read the following passage and answer the questions based on each.

From ancient times, men have believed that, under certain peculiar circumstances, life could arise spontaneously: from the ooze of rivers could come eels and from the entrails of dead bulls, bees; worms from mud, and maggots from dead meat. This belief

was held by Aristotle, Newton and Descartes, among many others, and apparently the great William Harvey too. The weight of centuries gradually disintegrated men's beliefs in the spontaneous origin of maggots and mice, but the doctrine of spontaneous generation clung tenaciously to the question of bacterial origin.

In association with Buffon, the Irish Jesuit priest, John Needham declared that he could bring about at will the creation of living microbes in heat-sterilized broths, and presumably, in propitiation, theorized that God did not create living things directly but bade the earth and water to bring them forth. In his Dictioinaire Philosophique, Voltaire reflected that it was odd to read of Father Needham's claim while atheists conversely 'should deny a Creator yet attribute to themselves the power of creating eels' But, wrote Thomas Huxley, 'The great tragedy of science — the slaying of a beautiful hypothesis by an ugly fact which is so constantly being enacted under the eyes of philosophers was played, almost immediately, for the benefits of Buffon and Needham.

The Italian Abbe Spallenzani did an experiment. He showed that a broth sealed from the air while boiling never develops bacterial growths and hence never decomposes. To Needham's objection that Spallenzani had ruined his broths and the air above them by excessive boiling, the Abbe replied by breaking the seals of his flasks. Air rushed in and bacterial growth began! But the essential conflict remained. Whatever Spallanzani and his followers did to remove seeds and contaminants was regarded by the spontaneous generationists as damaging to the 'vital force' from whence comes new life.

Thus, doubt remained, and into the controversy came the Titanic figure of Louis Pasteur. Believing that a solution to this problem was essential to the development of his theories concerning the role of bacteria in nature, Pasteur freely acknowledged the possibility that living bacteria very well might be arising anew from inanimate matter. To him, the research problem was largely a technical one: to repeat the work of those who claimed to have observed spontaneous generation but to employ infinite care to discover and exclude every possible concealed portal of bacterial entry. For the one that contended that life did not enter from the outside, the proof had to go to the question of possible contamination. Pasteur worked logically. After prolonged boiling, a broth would ferment only when air was admitted to it. Therefore, either air contained a factor necessary for the spontaneous generation of life or viable germs were borne by the air and seeded in the sterile nutrient broth. Pasteur designed ingenious flasks whose long Sshaped necks could be left open. Air was trapped in the sinuous glass tube. Broths boiled in these glass tubes remained sterile. When their necks were snapped to admit ordinary air, bacterial growth would then commence but not in every case. An occasional flask would remain sterile presumably because the bacterial population of the air is unevenly distributed. The forces of spontaneous generation would not be so erratic. Continuous scepticism drove Pasteur almost to fanatical efforts to control the ingredients of his experiments to destroy the doubts of the most sceptical. He ranged from the mountain air of Montanvert, which he showed to be almost sterile to those deep, clear wells whose waters had been rendered germ free by slow filtration through sandy soil. The latter discovery led to the familiar porcelain filters of the bacteriology laboratory. With pores small enough to exclude bacteria, solutions allowed to percolate through them could be reliably sterlised

The argument raged on and soon spilled beyond the boundaries of science to become a burning religious and philosophical question of the day. For many, Pasteur's conclusions caused conflict because they seemed simultaneously to support the Biblical account of creation while denying a variety of other philosophical systems. The public was soon caught up in the crossfire of a vigorous series of public lectures and demonstrations by leading exponents of both views, novelists, clergymen, their adjuncts and friends.

Perhaps the most famous of these evenings in the theatre competing perhaps with a great debate between Huxley and Bishop Wiberforce for elegance of rhetoric was Pasteur's public lecture at the Sorbonne on 7 April, 1864. Having shown his audience the swan necked flasks containing sterile broths, he concluded, "And, therefore, gentlemen, I could point to that liquid and say to you, I have taken my drop of water from the immensity of creation, and I have taken it full of the elements appropriated to the development of inferior beings. And I wait, I watch, I question it! — begging it to recommence for me the beautiful spectacle of the first creation. But it is dumb since these experiments were begun several years ago; it is dumb because I have kept it from the only thing man does not know how to produce: from the germs that float in the air, from Life, for Life is a germ and a germ is Life. Never will the doctrine of spontaneous generation recover from the mortal blow of this simple experiment." And it has not, Today these same flasks stand immutable: they are still free of microbial life.

It is an interesting fact that despite the ringing declaration of Pasteur, the issue did not die completely. And although far from healthy, it is not yet dead. In his fascinating biography of Pasteur, Rene Dubos has traced the later developments which saw new eruptions of the controversy, new technical progress and criticism, and new energetic figures in the breach of the battle such as Bastion, and the immortal Tyndall, against the doctrine of spontaneous generation. There was also new 'sorrow' for Pasteur as he read years later, in 1877, the last jottings of the great psychologist Claude Bernard and saw in them the 'mystical' suggestion that yeast may arise from grape juice. Even at this late date, Pasteurwas stirred to new experiments again to prove to the dead Bernard and his followers the correctness of his position.

It seems to me that spontaneous generation is not only a possibility, but a completely reasonable possibility which should never be relinquished from scientific thought. Before men knew of bacteria, they accepted the doctrine of spontaneous generation as the 'only reasonable alternative' to a belief in supernatural creation. But today, as we look with satisfaction at the downfall of the spontaneous generation hypothesis, we must not forget that science has rationally concluded that life once did originate on earth by spontaneous generation. It was really Pasteur's evidence against spontaneous generation that for the first time brought the whole difficult question of the origin of life before the scientific world. In the above controversy, what was unreasonable was the parade of men who claimed to have 'proved' or who resolutely 'believed in' spontaneous generation on the face of proof— not that spontaneous generation cannot occur — but that their work was shot through with experimental error. The acceptable evidence also makes it clear that spontaneous generation, if it does not occur, must obviously he. highly improbable

even under present conditions. Logic tells us that science can only prove an event improbable: it can never prove it impossible - and Gamow has appropriately remarked that nobody is really certain what would happen if a hermetically sealed can were opened after a couple of million years. Modem science agrees that it was highly improbable for life to have arisen in the pre-Cambrian seas, but it concluded, nevertheless, that there it did occur. With this, I think, Pasteur would agree.

Aside from their theoretical implications, these researchers had the great practical result of putting bacteriology on a solid footing. It was now clear how precisely careful one had to be to avoid bacterial contamination in the laboratory. We now knew what 'sterile' meant and knew that there could be no such thing as 'partial sterlisation'. The discovery of bacteria high in the upper atmosphere, in the mid of the deep see bottom, in the waters of hot springs, and in the Arctic glaciers established bacterial ubiquity as almost absolute. In recognition of this, Lord Lister introduced aseptic technique into the practice of surgery. It was the revolution in technique alone that made possible modern bacteriology and the subsequent research connecting bacteria to phenomena of human concern, research which today is more prodigious than ever. We are just beginning to understand the relationship to bacteria of certain human diseases, to soil chemistry, nutrition, and the phenomenon of antibiosis, wherein a product of one organism (e.g. penicillin) is detrimental to another.

It is not an exaggeration then to say that the emergence of the cell theory represents biology's most significant and fruitful advance. The realisation that all plants and animals are composed of cells which are essentially alike, that cells are all formed by the same fundamental division process, that the total organism is a whole made u of the activities and interrelations of its individual cells, opened up horizons we have not even begun to approach. The cell, is a microcosm of life, for in its origin, nature and continuity, resides the entire problem of biology.

Pasteur began his work on the basis of the contention that:

A. either air contained a factor necessary for the spontaneous generation of life or viable germs were borne in by the air and seeded in the sterile nutrient broth.
B. after prolonged boiling, a broth would ferment only when air was admitted to it.
C. both A and B
D. neither A nor B

## 5.2.182 English Language: CAT 1998 | Question: 129 top

Read the following passage and answer the questions based on each.

From ancient times, men have believed that, under certain peculiar circumstances, life could arise spontaneously: from the ooze of rivers could come eels and from the entrails of dead bulls, bees; worms from mud, and maggots from dead meat. This belief was held by Aristotle, Newton and Descartes, among many others, and apparently the great William Harvey too. The weight of centuries gradually disintegrated men's beliefs in the spontaneous origin of maggots and mice, but the doctrine of spontaneous generation clung tenaciously to the question of bacterial origin.

In association with Buffon, the Irish Jesuit priest, John Needham declared that he could bring about at will the creation of living microbes in heat-sterilized broths, and presumably, in propitiation, theorized that God did not create living things directly but bade the earth and water to bring them forth. In his Dictioinaire Philosophique, Voltaire reflected that it was odd to read of Father Needham's claim while atheists conversely 'should deny a Creator yet attribute to themselves the power of creating eels' But, wrote Thomas Huxley, 'The great tragedy of science — the slaying of a beautiful hypothesis by an ugly fact which is so constantly being enacted under the eyes of philosophers was played, almost immediately, for the benefits of Buffon and Needham.

The Italian Abbe Spallenzani did an experiment. He showed that a broth sealed from the air while boiling never develops bacterial growths and hence never decomposes. To Needham's objection that Spallenzani had ruined his broths and the air above them by excessive boiling, the Abbe replied by breaking the seals of his flasks. Air rushed in and bacterial growth began! But the essential conflict remained. Whatever Spallanzani and his followers did to remove seeds and contaminants was regarded by the spontaneous generationists as damaging to the 'vital force' from whence comes new life.

Thus, doubt remained, and into the controversy came the Titanic figure of Louis Pasteur. Believing that a solution to this problem was essential to the development of his theories concerning the role of bacteria in nature, Pasteur freely acknowledged the possibility that living bacteria very well might be arising anew from inanimate matter. To him, the research problem was largely a technical one: to repeat the work of those who claimed to have observed spontaneous generation but to employ infinite care to discover and exclude every possible concealed portal of bacterial entry. For the one that contended that life did not enter from the outside, the proof had to go to the question of possible contamination. Pasteur worked logically. After prolonged boiling, a broth would ferment only when air was admitted to it. Therefore, either air contained a factor necessary for the spontaneous generation of life or viable germs were borne by the air and seeded in the sterile nutrient broth. Pasteur designed ingenious flasks whose long Sshaped necks could be left open. Air was trapped in the sinuous glass tube. Broths boiled in these glass tubes remained sterile. When their necks were snapped to admit ordinary air, bacterial growth would then commence but not in every case. An occasional flask would remain sterile presumably because the bacterial population of the air is unevenly distributed. The forces of spontaneous generation would not be so erratic. Continuous scepticism drove Pasteur almost to fanatical efforts to control the ingredients of his experiments to destroy the doubts of the most sceptical. He ranged from the mountain air of Montanvert, which he showed to be almost sterile to those deep, clear wells whose waters had been

rendered germ free by slow filtration through sandy soil. The latter discovery led to the familiar porcelain filters of the bacteriology laboratory. With pores small enough to exclude bacteria, solutions allowed to percolate through them could be reliably sterlised

The argument raged on and soon spilled beyond the boundaries of science to become a burning religious and philosophical question of the day. For many, Pasteur's conclusions caused conflict because they seemed simultaneously to support the Biblical account of creation while denying a variety of other philosophical systems. The public was soon caught up in the crossfire of a vigorous series of public lectures and demonstrations by leading exponents of both views, novelists, clergymen, their adjuncts and friends.

Perhaps the most famous of these evenings in the theatre competing perhaps with a great debate between Huxley and Bishop Wiberforce for elegance of rhetoric was Pasteur's public lecture at the Sorbonne on 7 April, 1864. Having shown his audience the swan necked flasks containing sterile broths, he concluded, "And, therefore, gentlemen, I could point to that liquid and say to you, I have taken my drop of water from the immensity of creation, and I have taken it full of the elements appropriated to the development of inferior beings. And I wait, I watch, I question it! — begging it to recommence for me the beautiful spectacle of the first creation. But it is dumb since these experiments were begun several years ago; it is dumb because I have kept it from the only thing man does not know how to produce: from the germs that float in the air, from Life, for Life is a germ and a germ is Life. Never will the doctrine of spontaneous generation recover from the mortal blow of this simple experiment." And it has not, Today these same flasks stand immutable: they are still free of microbial life.

It is an interesting fact that despite the ringing declaration of Pasteur, the issue did not die completely. And although far from healthy, it is not yet dead. In his fascinating biography of Pasteur, Rene Dubos has traced the later developments which saw new eruptions of the controversy, new technical progress and criticism, and new energetic figures in the breach of the battle such as Bastion, and the immortal Tyndall, against the doctrine of spontaneous generation. There was also new 'sorrow' for Pasteur as he read years later, in 1877, the last jottings of the great psychologist Claude Bernard and saw in them the 'mystical' suggestion that yeast may arise from grape juice. Even at this late date, Pasteurwas stirred to new experiments again to prove to the dead Bernard and his followers the correctness of his position.

It seems to me that spontaneous generation is not only a possibility, but a completely reasonable possibility which should never be relinquished from scientific thought. Before men knew of bacteria, they accepted the doctrine of spontaneous generation as the 'only reasonable alternative' to a belief in supernatural creation. But today, as we look with satisfaction at the downfall of the spontaneous generation hypothesis, we must not forget that science has rationally concluded that life once did originate on earth by spontaneous generation. It was really Pasteur's evidence against spontaneous generation that for the first time brought the whole difficult question of the origin of life before the scientific world. In the above controversy, what was unreasonable was the parade of men who claimed to have 'proved' or who resolutely 'believed in' spontaneous generation on the face of proof— not that spontaneous generation cannot occur — but that their work was shot through with experimental error. The acceptable evidence also makes it clear that spontaneous generation, if it does not occur, must obviously he. highly improbable even under present conditions. Logic tells us that science can only prove an event improbable: it can never prove it impossible - and Gamow has appropriately remarked that nobody is really certain what would happen if a hermetically sealed can were opened after a couple of million years. Modem science agrees that it was highly improbable for life to have arisen in the pre-Cambrian seas, but it concluded, nevertheless, that there it did occur. With this, I think, Pasteur would agree.

Aside from their theoretical implications, these researchers had the great practical result of putting bacteriology on a solid footing. It was now clear how precisely careful one had to be to avoid bacterial contamination in the laboratory. We now knew what 'sterile' meant and knew that there could be no such thing as 'partial sterlisation'. The discovery of bacteria high in the upper atmosphere, in the mid of the deep see bottom, in the waters of hot springs, and in the Arctic glaciers established bacterial ubiquity as almost absolute. In recognition of this, Lord Lister introduced aseptic technique into the practice of surgery. It was the revolution in technique alone that made possible modern bacteriology and the subsequent research connecting bacteria to phenomena of human concern, research which today is more prodigious than ever. We are just beginning to understand the relationship to bacteria of certain human diseases, to soil chemistry, nutrition, and the phenomenon of antibiosis, wherein a product of one organism (e.g. penicillin) is detrimental to another.

It is not an exaggeration then to say that the emergence of the cell theory represents biology's most significant and fruitful advance. The realisation that all plants and animals are composed of cells which are essentially alike, that cells are all formed by the same fundamental division process, that the total organism is a whole made u of the activities and interrelations of its individual cells, opened up horizons we have not even begun to approach. The cell, is a microcosm of life, for in its origin, nature and continuity, resides the entire problem of biology.

The porcelian filters of the bacteriology laboratories owed their descent to:

A. Pasteur's homeland.
B. The well water of Montanvert that had been rendered germ free by slow filtration through sandy soil.
C. Both a) and b).
D. None of the above.

## 5.2.184 English Language: CAT 1998 | Question: 130 top

Read the following passage and answer the questions based on each.

From ancient times, men have believed that, under certain peculiar circumstances, life could arise spontaneously: from the ooze of rivers could come eels and from the entrails of dead bulls, bees; worms from mud, and maggots from dead meat. This belief was held by Aristotle, Newton and Descartes, among many others, and apparently the great William Harvey too. The weight of centuries gradually disintegrated men's beliefs in the spontaneous origin of maggots and mice, but the doctrine of spontaneous generation clung tenaciously to the question of bacterial origin.

In association with Buffon, the Irish Jesuit priest, John Needham declared that he could bring about at will the creation of living microbes in heat-sterilized broths, and presumably, in propitiation, theorized that God did not create living things directly but bade the earth and water to bring them forth. In his Dictioinaire Philosophique, Voltaire reflected that it was odd to read of Father Needham's claim while atheists conversely 'should deny a Creator yet attribute to themselves the power of creating eels' But, wrote Thomas Huxley, 'The great tragedy of science — the slaying of a beautiful hypothesis by an ugly fact which is so constantly being enacted under the eyes of philosophers was played, almost immediately, for the benefits of Buffon and Needham.

The Italian Abbe Spallenzani did an experiment. He showed that a broth sealed from the air while boiling never develops bacterial growths and hence never decomposes. To Needham's objection that Spallenzani had ruined his broths and the air above them by excessive boiling, the Abbe replied by breaking the seals of his flasks. Air rushed in and bacterial growth began! But the essential conflict remained. Whatever Spallanzani and his followers did to remove seeds and contaminants was regarded by the spontaneous generationists as damaging to the 'vital force' from whence comes new life.

Thus, doubt remained, and into the controversy came the Titanic figure of Louis Pasteur. Believing that a solution to this problem was essential to the development of his theories concerning the role of bacteria in nature, Pasteur freely acknowledged the possibility that living bacteria very well might be arising anew from inanimate matter. To him, the research problem was largely a technical one: to repeat the work of those who claimed to have observed spontaneous generation but to employ infinite care to discover and exclude every possible concealed portal of bacterial entry. For the one that contended that life did not enter from the outside, the proof had to go to the question of possible contamination. Pasteur worked logically. After prolonged boiling, a broth would ferment only when air was admitted to it. Therefore, either air contained a factor necessary for the spontaneous generation of life or viable germs were borne by the air and seeded in the sterile nutrient broth. ## 5.2.187 English Language: CAT 1998 | Question: 133 top

Read the following passage and answer the questions based on each.

From ancient times, men have believed that, under certain peculiar circumstances, life could arise spontaneously: from the ooze of rivers could come eels and from the entrails of dead bulls, bees; worms from mud, and maggots from dead meat. This belief was held by Aristotle, Newton and Descartes, among many others, and apparently the great William Harvey too. The weight of centuries gradually disintegrated men's beliefs in the spontaneous origin of maggots and mice, but the doctrine of spontaneous generation clung tenaciously to the question of bacterial origin.

In association with Buffon, the Irish Jesuit priest, John Needham declared that he could bring about at will the creation of living microbes in heat-sterilized broths, and presumably, in propitiation, theorized that God did not create living things directly but bade the earth and water to bring them forth. In his Dictioinaire Philosophique, Voltaire reflected that it was odd to read of Father Needham's claim while atheists conversely 'should deny a Creator yet attribute to themselves the power of creating eels' But, wrote Thomas Huxley, 'The great tragedy of science — the slaying of a beautiful hypothesis by an ugly fact which is so constantly being enacted under the eyes of philosophers was played, almost immediately, for the benefits of Buffon and Needham.

The Italian Abbe Spallenzani did an experiment. He showed that a broth sealed from the air while boiling never develops bacterial growths and hence never decomposes. To Needham's objection that Spallenzani had ruined his broths and the air above them by excessive boiling, the Abbe replied by breaking the seals of his flasks. Air rushed in and bacterial growth began! But the essential conflict remained. Whatever Spallanzani and his followers did to remove seeds and contaminants was

regarded by the spontaneous generationists as damaging to the ‘vital force’ from whence comes new life.

Thus, doubt remained, and into the controversy came the Titanic figure of Louis Pasteur. Believing that a solution to this problem was essential to the development of his theories concerning the role of bacteria in nature, Pasteur freely acknowledged the possibility that living bacteria very well might be arising anew from inanimate matter. To him, the research problem was largely a technical one: to repeat the work of those who claimed to have observed spontaneous generation but to employ infinite care to discover and exclude every possible concealed portal of bacterial entry. For the one that contended that life did not enter from the outside, the proof had to go to the question of possible contamination. Pasteur worked logically. After prolonged boiling, a broth would ferment only when air was admitted to it. Therefore, either air contained a factor necessary for the spontaneous generation of life or viable germs were borne by the air and seeded in the sterile nutrient broth. Pasteur designed ingenious flasks whose long Sshaped necks could be left open. Air was trapped in the sinuous glass tube. Broths boiled in these glass tubes remained sterile. When their necks were snapped to admit ordinary air, bacterial growth would then commence but not in every case. An occasional flask would remain sterile presumably because the bacterial population of the air is unevenly distributed. The forces of spontaneous generation would not be so erratic. Continuous scepticism drove Pasteur almost to fanatical efforts to control the ingredients of his experiments to destroy the doubts of the most sceptical. He ranged from the mountain air of Montanvert, which he showed to be almost sterile to those deep, clear wells whose waters had been rendered germ free by slow filtration through sandy soil. The latter discovery led to the familiar porcelain filters of the bacteriology laboratory. With pores small enough to exclude bacteria, solutions allowed to percolate through them could be reliably sterlised

The argument raged on and soon spilled beyond the boundaries of science to become a burning religious and philosophical question of the day. For many, Pasteur’s conclusions caused conflict because they seemed simultaneously to support the Biblical account of creation while denying a variety of other philosophical systems. The public was soon caught up in the crossfire of a vigorous series of public lectures and demonstrations by leading exponents of both views, novelists, clergymen, their adjuncts and friends.

Perhaps the most famous of these evenings in the theatre competing perhaps with a great debate between Huxley and Bishop Wiberforce for elegance of rhetoric was Pasteur’s public lecture at the Sorbonne on 7 April, 1864. Having shown his audience the swan necked flasks containing sterile broths, he concluded, “And, therefore, gentlemen, I could point to that liquid and say to you, I have taken my drop of water from the immensity of creation, and I have taken it full of the elements appropriated to the development of inferior beings. And I wait, I watch, I question it! — begging it to recommence for me the beautiful spectacle of the first creation. But it is dumb since these experiments were begun several years ago; it is dumb because I have kept it from the only thing man does not know how to produce: from the germs that float in the air, from Life, for Life is a germ and a germ is Life. Never will the doctrine of spontaneous generation recover from the mortal blow of this simple experiment.” And it has not, Today these same flasks stand immutable: they are still free of microbial life.

It is an interesting fact that despite the ringing declaration of Pasteur, the issue did not die completely. And although far from healthy, it is not yet dead. In his fascinating biography of Pasteur, Rene Dubos has traced the later developments which saw new eruptions of the controversy, new technical progress and criticism, and new energetic figures in the breach of the battle such as Bastion, and the immortal Tyndall, against the doctrine of spontaneous generation. There was also new ‘sorrow’ for Pasteur as he read years later, in 1877, the last jottings of the great psychologist Claude Bernard and saw in them the ‘mystical’ suggestion that yeast may arise from grape juice. Even at this late date, Pasteurwas stirred to new experiments again to prove to the dead Bernard and his followers the correctness of his position.

It seems to me that spontaneous generation is not only a possibility, but a completely reasonable possibility which should never be relinquished from scientific thought. Before men knew of bacteria, they accepted the doctrine of spontaneous generation as the ‘only reasonable alternative’ to a belief in supernatural creation. But today, as we look with satisfaction at the downfall of the spontaneous generation hypothesis, we must not forget that science has rationally concluded that life once did originate on earth by spontaneous generation. It was really Pasteur’s evidence against spontaneous generation that for the first time brought the whole difficult question of the origin of life before the scientific world. In the above controversy, what was unreasonable was the parade of men who claimed to have ‘proved’ or who resolutely ‘believed in’ spontaneous generation on the face of proof— not that spontaneous generation cannot occur — but that their work was shot through with experimental error. The acceptable evidence also makes it clear that spontaneous generation, if it does not occur, must obviously he. highly improbable even under present conditions. Logic tells us that science can only prove an event improbable: it can never prove it impossible - and Gamow has appropriately remarked that nobody is really certain what would happen if a hermetically sealed can were opened after a couple of million years. Modem science agrees that it was highly improbable for life to have arisen in the pre-Cambrian seas, but it concluded, nevertheless, that there it did occur. With this, I think, Pasteur would agree.

Aside from their theoretical implications, these researchers had the great practical result of putting bacteriology on a solid footing. It was now clear how precisely careful one had to be to avoid bacterial contamination in the laboratory. We now knew what ‘sterile’ meant and knew that there could be no such thing as ‘partial sterlisation’. The discovery of bacteria high in the upper atmosphere, in the mid of the deep see bottom, in the waters of hot springs, and in the Arctic glaciers established bacterial ubiquity as almost absolute. In recognition of this, Lord Lister introduced aseptic technique into the practice of surgery. It was the revolution in technique alone that made possible modern bacteriology and the subsequent research connecting bacteria to phenomena of human concern, research which today is more prodigious than ever. We are just beginning to understand the relationship to bacteria of certain human diseases, to soil chemistry, nutrition, and the phenomenon of antibiosis, wherein a product of one organism (e.g. penicillin) is detrimental to another.

It is not an exaggeration then to say that the emergence of the cell theory represents biology’s most significant and fruitful

advance. The realisation that all plants and animals are composed of cells which are essentially alike, that cells are all formed by the same fundamental division process, that the total organism is a whole made u of the activities and interrelations of its individual cells, opened up horizons we have not even begun to approach. The cell, is a microcosm of life, for in its origin, nature and continuity, resides the entire problem of biology.

One of the reasons for the conflict caused by Pasteur's experiments was that:

A. they denied the existence of God as the Creator.
B. they seemed simultaneously to support the Biblical account of creation while denying a variety of other philosophical systems.
C. academicians and scientists refused to accept his theories.
D. there were too many debates on the topic and this left the people confused.

## 5.2.188 English Language: CAT 1998 | Question: 134 top

Read the following passage and answer the questions based on each.

From ancient times, men have believed that, under certain peculiar circumstances, life could arise spontaneously: from the ooze of rivers could come eels and from the entrails of dead bulls, bees; worms from mud, and maggots from dead meat. This belief was held by Aristotle, Newton and Descartes, among many others, and apparently the great William Harvey too. The weight of centuries gradually disintegrated men's beliefs in the spontaneous origin of maggots and mice, but the doctrine of spontaneous generation clung tenaciously to the question of bacterial origin.

In association with Buffon, the Irish Jesuit priest, John Needham declared that he could bring about at will the creation of living microbes in heat-sterilized broths, and presumably, in propitiation, theorized that God did not create living things directly but bade the earth and water to bring them forth. In his Dictioinaire Philosophique, Voltaire reflected that it was odd to read of Father Needham's claim while atheists conversely 'should deny a Creator yet attribute to themselves the power of creating eels' But, wrote Thomas Huxley, 'The great tragedy of science — the slaying of a beautiful hypothesis by an ugly fact which is so constantly being enacted under the eyes of philosophers was played, almost immediately, for the benefits of Buffon and Needham.

The Italian Abbe Spallenzani did an experiment. He showed that a broth sealed from the air while boiling never develops bacterial growths and hence never decomposes. To Needham's objection that Spallenzani had ruined his broths and the air above them by excessive boiling, the Abbe replied by breaking the seals of his flasks. Air rushed in and bacterial growth began! But the essential conflict remained. Whatever Spallanzani and his followers did to remove seeds and contaminants was regarded by the spontaneous generationists as damaging to the 'vital force' from whence comes new life.

Thus, doubt remained, and into the controversy came the Titanic figure of Louis Pasteur. Believing that a solution to this problem was essential to the development of his theories concerning the role of bacteria in nature, Pasteur freely acknowledged the possibility that living bacteria very well might be arising anew from inanimate matter. The realisation that all plants and animals are composed of cells which are essentially alike, that cells are all formed by the same fundamental division process, that the total organism is a whole made u of the activities and interrelations of its individual cells, opened up horizons we have not even begun to approach. The cell, is a microcosm of life, for in its origin, nature and continuity, resides the entire problem of biology.

According to the passage.

A. Pasteur's precursors in the field worked on the basis of spontaneous generation.
B. Unlike his predecessors, Pasteur worked on logical premises rather than arbitrary and spontaneous discoveries.
C. Pasteur stood to benefit largely from the work of his predecessors.
D. Pasteur developed the ideas set forth by Voltaire and Needham.

## 5.2.191 English Language: CAT 1998 | Question: 137 top

Read the following passage and answer the questions based on each.

From ancient times, men have believed that, under certain peculiar circumstances, life could arise spontaneously: from the ooze of rivers could come eels and from the entrails of dead bulls, bees; worms from mud, and maggots from dead meat. This belief was held by Aristotle, Newton and Descartes, among many others, and apparently the great William Harvey too. The weight of centuries gradually disintegrated men's beliefs in the spontaneous origin of maggots and mice, but the doctrine of spontaneous generation clung tenaciously to the question of bacterial origin.

In association with Buffon, the Irish Jesuit priest, John Needham declared that he could bring about at will the creation of living microbes in heat-sterilized broths, and presumably, in propitiation, theorized that God did not create living things

directly but bade the earth and water to bring them forth. In his Dictioinaire Philosophique, Voltaire reflected that it was odd to read of Father Needham's claim while atheists conversely 'should deny a Creator yet attribute to themselves the power of creating eels' But, wrote Thomas Huxley, 'The great tragedy of science — the slaying of a beautiful hypothesis by an ugly fact which is so constantly being enacted under the eyes of philosophers was played, almost immediately, for the benefits of Buffon and Needham.

The Italian Abbe Spallenzani did an experiment. He showed that a broth sealed from the air while boiling never develops bacterial growths and hence never decomposes. To Needham's objection that Spallenzani had ruined his broths and the air above them by excessive boiling, the Abbe replied by breaking the seals of his flasks. Air rushed in and bacterial growth began! But the essential conflict remained. Whatever Spallanzani and his followers did to remove seeds and contaminants was regarded by the spontaneous generationists as damaging to the 'vital force' from whence comes new life.

Thus, doubt remained, and into the controversy came the Titanic figure of Louis Pasteur. Believing that a solution to this problem was essential to the development of his theories concerning the role of bacteria in nature, Pasteur freely acknowledged the possibility that living bacteria very well might be arising anew from inanimate matter. To him, the research problem was largely a technical one: to repeat the work of those who claimed to have observed spontaneous generation but to employ infinite care to discover and exclude every possible concealed portal of bacterial entry. For the one that contended that life did not enter from the outside, the proof had to go to the question of possible contamination. Pasteur worked logically. After prolonged boiling, a broth would ferment only when air was admitted to it. Therefore, either air contained a factor necessary for the spontaneous generation of life or viable germs were borne by the air and seeded in the sterile nutrient broth. Pasteur designed ingenious flasks whose long Sshaped necks could be left open. Air was trapped in the sinuous glass tube. Broths boiled in these glass tubes remained sterile. When their necks were snapped to admit ordinary air, bacterial growth would then commence but not in every case. An occasional flask would remain sterile presumably because the bacterial population of the air is unevenly distributed. The forces of spontaneous generation would not be so erratic. Continuous scepticism drove Pasteur almost to fanatical efforts to control the ingredients of his experiments to destroy the doubts of the most sceptical. He ranged from the mountain air of Montanvert, which he showed to be almost sterile to those deep, clear wells whose waters had been rendered germ free by slow filtration through sandy soil. The latter discovery led to the familiar porcelain filters of the bacteriology laboratory. With pores small enough to exclude bacteria, solutions allowed to percolate through them could be reliably sterlised

The argument raged on and soon spilled beyond the boundaries of science to become a burning religious and philosophical question of the day. For many, Pasteur's conclusions caused conflict because they seemed simultaneously to support the Biblical account of creation while denying a variety of other philosophical systems. The public was soon caught up in the crossfire of a vigorous series of public lectures and demonstrations by leading exponents of both views, novelists, clergymen, their adjuncts and friends.

Perhaps the most famous of these evenings in the theatre competing perhaps with a great debate between Huxley and Bishop Wiberforce for elegance of rhetoric was Pasteur's public lecture at the Sorbonne on 7 April, 1864. Having shown his audience the swan necked flasks containing sterile broths, he concluded, "And, therefore, gentlemen, I could point to that liquid and say to you, I have taken my drop of water from the immensity of creation, and I have taken it full of the elements appropriated to the development of inferior beings. And I wait, I watch, I question it! — begging it to recommence for me the beautiful spectacle of the first creation. But it is dumb since these experiments were begun several years ago; it is dumb because I have kept it from the only thing man does not know how to produce: from the germs that float in the air, from Life, for Life is a germ and a germ is Life. Never will the doctrine of spontaneous generation recover from the mortal blow of this simple experiment." And it has not, Today these same flasks stand immutable: they are still free of microbial life.

It is an interesting fact that despite the ringing declaration of Pasteur, the issue did not die completely. And although far from healthy, it is not yet dead. In his fascinating biography of Pasteur, Rene Dubos has traced the later developments which saw new eruptions of the controversy, new technical progress and criticism, and new energetic figures in the breach of the battle such as Bastion, and the immortal Tyndall, against the doctrine of spontaneous generation. There was also new 'sorrow' for Pasteur as he read years later, in 1877, the last jottings of the great psychologist Claude Bernard and saw in them the 'mystical' suggestion that yeast may arise from grape juice. Even at this late date, Pasteurwas stirred to new experiments again to prove to the dead Bernard and his followers the correctness of his position.

It seems to me that spontaneous generation is not only a possibility, but a completely reasonable possibility which should never be relinquished from scientific thought. Before men knew of bacteria, they accepted the doctrine of spontaneous generation as the 'only reasonable alternative' to a belief in supernatural creation. But today, as we look with satisfaction at the downfall of the spontaneous generation hypothesis, we must not forget that science has rationally concluded that life once did originate on earth by spontaneous generation. It was really Pasteur's evidence against spontaneous generation that for the first time brought the whole difficult question of the origin of life before the scientific world. In the above controversy, what was unreasonable was the parade of men who claimed to have 'proved' or who resolutely 'believed in' spontaneous generation on the face of proof— not that spontaneous generation cannot occur — but that their work was shot through with experimental error. The acceptable evidence also makes it clear that spontaneous generation, if it does not occur, must obviously he. highly improbable even under present conditions. Logic tells us that science can only prove an event improbable: it can never prove it impossible - and Gamow has appropriately remarked that nobody is really certain what would happen if a hermetically sealed can were opened after a couple of million years. Modem science agrees that it was highly improbable for life to have arisen in the pre-Cambrian seas, but it concluded, nevertheless, that there it did occur. With this, I think, Pasteur would agree.

Aside from their theoretical implications, these researchers had the great practical result of putting bacteriology on a solid

footing. It was now clear how precisely careful one had to be to avoid bacterial contamination in the laboratory. We now knew what ‘sterile’ meant and knew that there could be no such thing as ‘partial sterlisation’. The discovery of bacteria high in the upper atmosphere, in the mid of the deep see bottom, in the waters of hot springs, and in the Arctic glaciers established bacterial ubiquity as almost absolute. In recognition of this, Lord Lister introduced aseptic technique into the practice of surgery. It was the revolution in technique alone that made possible modern bacteriology and the subsequent research connecting bacteria to phenomena of human concern, research which today is more prodigious than ever. We are just beginning to understand the relationship to bacteria of certain human diseases, to soil chemistry, nutrition, and the phenomenon of antibiosis, wherein a product of one organism (e.g. penicillin) is detrimental to another.

It is not an exaggeration then to say that the emergence of the cell theory represents biology’s most significant and fruitful advance. The realisation that all plants and animals are composed of cells which are essentially alike, that cells are all formed by the same fundamental division process, that the total organism is a whole made u of the activities and interrelations of its individual cells, opened up horizons we have not even begun to approach. The cell, is a microcosm of life, for in its origin, nature and continuity, resides the entire problem of biology.

Needham’s theory that ‘God did not create living things directly was posited as

A. An attempt to support his assertion by religious doctrine.
B. An attempt at placating his religious peers.
C. An attempt at propitiating a possibly offended God or the religious psyche of the time.
D. All of the above.

cat1998 english-language passage-reading

## 5.2.192 English Language: CAT 1998 | Question: 138 top

Read the following passages and answer the questions based on each.

In his book "About Behaviourism", Dr. B.F. Skinner, the noted behavioural psychiatrist, lists the 20 most salient objections to behaviourism and goes on to answer them. He has answers and explanations for every one. For instance, to those who object that behaviourism “neglects innate endowment and argues that all behaviour is acquired during the lifetime of the individual,” Dr. Skinner expresses puzzlement. Granted, “a few behaviourists in their enthusiasm for what may be done through the environment, have minimised or even denied genetic contribution. But others have no doubt acted as if a genetic endowment were unimportant. Few would actually contend that behaviour is endlessly malleable.” And Dr. Skinner himself, sounding as often as not like some latter-day social Darwinist, gives as much weight to the ‘contingencies of survival’ in the evolution of the human species as to the ‘contingencies of reinforcement’ in the lifetime of the individual. Dr Skinner is a radical behaviourist. Radical behaviourism does not deny the possibility of self-observation or self-knowledge.

To those who claim that behaviourism "Cannot explain Creative achievements - in arts, in music, literature, science or mathematics," Dr. Skinner provides an intriguing ellipsis. "Contingencies of reinforcement also resemble contingencies of survival in the production of novelty. In both natural selection and operand conditions, the appearance of mutations is crucial. Until recently, species evolved because of random changes in genes or chromosomes, but the geneticist may arrange conditions under which mutations are particularly likely to occur. We can discover some of the sources of the new forms of behaviour which undergo selection by prevailing contingencies or reinforcement, and fortunately, the creative artist or thinker has other ways of introducing novelties."

Dr. Skinner’s answers to the 20 questions he poses — questions that range all the way from investigating that behaviourism fails ‘to account for cognitive processes’ to wondering if behaviourism ‘is indifferent to the warmth and richness of human life, and is incompatible with the enjoyment of art, music .and with love for one’s fellow men,’ But will it wash? Will it serve to serve those critics who have characterised Skinner variously as a mad, manipulative doctor, as a native nineteenth-century positivist, as an unscientific technician, an arrogant social engineer? There is no gainsaying that ‘About Behaviourism’ is an unusually compact summing up of both the history and ‘the philosophy of the science of human behaviour’ (as Dr. Skinner insists on defining behaviourism). It is a veritable artwork of organisation. And anyone who reads it will never again be able to think of behaviourism as simplistic philosophy that reduces human-being to black boxes responding robotlike to external stimuli.

Still, there are certain quandaries that the book does not quite dispel. For one thing, though Dr Skinner makes countless references to the advances in experiments with human beings that behaviourism has made since it first began running rats through mazes six or seven decades go, he fails to provide a single illustration of these advances. And though it may be true, as Dr Skinner argues that one can extrapolate from pigeons to people, it would be reassuring to be shown precisely how. More important, he has not satisfactorily rebutted the basic criticism that behaviourism “is scientistic rather than scientific; it merely emulates the sciences.’ A true science doesn’t predict in advance what it will accomplish when it is firmly established as a science, not even when it is posing as ‘the philosophy of that science.’ A true science simply advances rules for testing hypothesis. But Dr Skinner predicts that behaviourism will produce the means to save human society from impending disaster. Two key concepts that keep according to that prediction are ‘manipulation’, and ‘control’. And so while he reassures us quite persuasively that science would practise those concepts benignly, one can’t shake off the suspicion that he was advancing a science just in order to save society by means of ‘manipulation’ and ‘control’, and that is not so reassuring.

What would be nearest in meaning of lie sentence: “Dr Skinner provides an intriguing ellipsis”?

1. he provides a complicated explanation
2. he provides a concise explanation
3. he deviates from the point
4. he provides a viable explanation

cat1998 english-language passage-reading

## 5.2.193 English Language: CAT 1998 | Question: 139 top

Read the following passages and answer the questions based on each.

In his book "About Behaviourism", Dr. B.F. Skinner, the noted behavioural psychiatrist, lists the 20 most salient objections to behaviourism and goes on to answer them. He has answers and explanations for every one. For instance, to those who object that behaviourism “neglects innate endowment and argues that all behaviour is acquired during the lifetime of the individual,” Dr. Skinner expresses puzzlement. Granted, “a few behaviourists in their enthusiasm for what may be done through the environment, have minimised or even denied genetic contribution. But others have no doubt acted as if a genetic endowment were unimportant. Few would actually contend that behaviour is endlessly malleable.” And Dr. Skinner himself, sounding as often as not like some latter-day social Darwinist, gives as much weight to the ‘contingencies of survival’ in the evolution of the human species as to the ‘contingencies of reinforcement’ in the lifetime of the individual. Dr Skinner is a radical behaviourist. Radical behaviourism does not deny the possibility of self-observation or self-knowledge.

To those who claim that behaviourism "Cannot explain Creative achievements - in arts, in music, literature, science or mathematics," Dr. Skinner provides an intriguing ellipsis. "Contingencies of reinforcement also resemble contingencies of survival in the production of novelty. In both natural selection and operand conditions, the appearance of mutations is crucial. ## 5.2.195 English Language: CAT 1998 | Question: 140 top

Read the following passages and answer the questions based on each.

In his book "About Behaviourism", Dr. B.F. Skinner, the noted behavioural psychiatrist, lists the 20 most salient objections to behaviourism and goes on to answer them. He has answers and explanations for every one. For instance, to those who object that behaviourism “neglects innate endowment and argues that all behaviour is acquired during the lifetime of the individual,” Dr. Skinner expresses puzzlement. Granted, “a few behaviourists in their enthusiasm for what may be done through the environment, have minimised or even denied genetic contribution. But others have no doubt acted as if a genetic endowment were unimportant. Few would actually contend that behaviour is endlessly malleable.” And Dr. Skinner himself, sounding as often as not like some latter-day social Darwinist, gives as much weight to the ‘contingencies of survival’ in the evolution of the human species as to the ‘contingencies of reinforcement’ in the lifetime of the individual. Dr Skinner is a radical behaviourist. Radical behaviourism does not deny the possibility of self-observation or self-knowledge.

To those who claim that behaviourism "Cannot explain Creative achievements - in arts, in music, literature, science or mathematics," Dr. Skinner provides an intriguing ellipsis. "Contingencies of reinforcement also resemble contingencies of survival in the production of novelty. In both natural selection and operand conditions, the appearance of mutations is crucial. Until recently, species evolved because of random changes in genes or chromosomes, but the geneticist may arrange conditions under which mutations are particularly likely to occur. We can discover some of the sources of the new forms of behaviour which undergo selection by prevailing contingencies or reinforcement, and fortunately, the creative artist or thinker has other ways of introducing novelties."

Dr. Skinner’s answers to the 20 questions he poses — questions that range all the way from investigating that behaviourism fails ‘to account for cognitive processes’ to wondering if behaviourism ‘is indifferent to the warmth and richness of human life, and is incompatible with the enjoyment of art, music .and with love for one’s fellow men,’ But will it wash? Will it serve to serve those critics who have characterised Skinner variously as a mad, manipulative doctor, as a native nineteenth-century positivist, as an unscientific technician, an arrogant social engineer? There is no gainsaying that ‘About Behaviourism’ is an unusually compact summing up of both the history and ‘the philosophy of the science of human behaviour’ (as Dr. Skinner insists on defining behaviourism). It is a veritable artwork of organisation. And anyone who reads it will never again be able to think of behaviourism as simplistic philosophy that reduces human-being to black boxes responding robotlike to external stimuli.

Still, there are certain quandaries that the book does not quite dispel. For one thing, though Dr Skinner makes countless references to the advances in experiments with human beings that behaviourism has made since it first began running rats through mazes six or seven decades go, he fails to provide a single illustration of these advances. And though it may be true, as Dr Skinner argues that one can extrapolate from pigeons to people, it would be reassuring to be shown precisely how. More important, he has not satisfactorily rebutted the basic criticism that behaviourism “is scientistic rather than scientific; it merely emulates the sciences.’ A true science doesn’t predict in advance what it will accomplish when it is firmly established as a science, not even when it is posing as ‘the philosophy of that science.’ A true science simply advances rules for testing hypothesis. But Dr Skinner predicts that behaviourism will produce the means to save human society from impending disaster. Two key concepts that keep according to that prediction are ‘manipulation’, and ‘control’. And so while he reassures us quite persuasively that science would practise those concepts benignly, one can’t shake off the suspicion that he was advancing a science just in order to save society by means of ‘manipulation’ and ‘control’, and that is not so reassuring.

From the passage it can be inferred that the book mentioned here deals with:

A. answers to questions about behaviourism
B. the science of behaviourism
C. behaviourism and human life
D. a list of questions and answers on the science of behaviourism.

cat1998 english-language passage-reading

## 5.2.196 English Language: CAT 1998 | Question: 141 top

Read the following passages and answer the questions based on each.

In his book "About Behaviourism", Dr. B.F. Skinner, the noted behavioural psychiatrist, lists the 20 most salient objections to behaviourism and goes on to answer them. He has answers and explanations for every one. For instance, to those who object that behaviourism “neglects innate endowment and argues that all behaviour is acquired during the lifetime of the individual,” Dr. Skinner expresses puzzlement. Granted, “a few behaviourists in their enthusiasm for what may be done through the environment, have minimised or even denied genetic contribution. But others have no doubt acted as if a genetic endowment were unimportant. Few would actually contend that behaviour is endlessly malleable.” And Dr. Skinner himself, sounding as often as not like some latter-day social Darwinist, gives as much weight to the ‘contingencies of survival’ in the evolution of the human species as to the ‘contingencies of reinforcement’ in the lifetime of the individual. Dr Skinner is a radical behaviourist. Radical behaviourism does not deny the possibility of self-observation or self-knowledge.

To those who claim that behaviourism "Cannot explain Creative achievements - in arts, in music, literature, science or mathematics," Dr. Skinner provides an intriguing ellipsis. "Contingencies of reinforcement also resemble contingencies of survival in the production of novelty. In both natural selection and operand conditions, the appearance of mutations is crucial. Until recently, species evolved because of random changes in genes or chromosomes, but the geneticist may arrange conditions under which mutations are particularly likely to occur. We can discover some of the sources of the new forms of behaviour

which undergo selection by prevailing contingencies or reinforcement, and fortunately, the creative artist or thinker has other ways of introducing novelties."

Dr. Skinner's answers to the 20 questions he poses — questions that range all the way from investigating that behaviourism fails 'to account for cognitive processes' to wondering if behaviourism 'is indifferent to the warmth and richness of human life, and is incompatible with the enjoyment of art, music .and with love for one's fellow men,' But will it wash? Will it serve to serve those critics who have characterised Skinner variously as a mad, manipulative doctor, as a native nineteenth-century positivist, as an unscientific technician, an arrogant social engineer? There is no gainsaying that 'About Behaviourism' is an unusually compact summing up of both the history and 'the philosophy of the science of human behaviour' (as Dr. Skinner insists on defining behaviourism). It is a veritable artwork of organisation. And anyone who reads it will never again be able to think of behaviourism as simplistic philosophy that reduces human-being to black boxes responding robotlike to external stimuli.

Still, there are certain quandaries that the book does not quite dispel. For one thing, though Dr Skinner makes countless references to the advances in experiments with human beings that behaviourism has made since it first began running rats through mazes six or seven decades go, he fails to provide a single illustration of these advances. And though it may be true, as Dr Skinner argues that one can extrapolate from pigeons to people, it would be reassuring to be shown precisely how. More important, he has not satisfactorily rebutted the basic criticism that behaviourism "is scientistic rather than scientific; it merely emulates the sciences.' A true science doesn't predict in advance what it will accomplish when it is firmly established as a science, not even when it is posing as 'the philosophy of that science.' A true science simply advances rules for testing hypothesis. But Dr Skinner predicts that behaviourism will produce the means to save human society from impending disaster. Two key concepts that keep according to that prediction are 'manipulation', and 'control'. And so while he reassures us quite persuasively that science would practise those concepts benignly, one can't shake off the suspicion that he was advancing a science just in order to save society by means of 'manipulation' and 'control', and that is not so reassuring.

It can be inferred from the passage that Dr. Skinner is a:

A. behavioural psychologist who explains the values of behaviourism
B. a radical 'behaviourist' who accepts the possibility of self-knowledge
C. behaviourist who denies existence of sensations and feelings of human life
D. a scientist who advocates methodological behaviourism.

## 5.2.197 English Language: CAT 1998 | Question: 142 top

Read the following passages and answer the questions based on each.

In his book "About Behaviourism", Dr. B.F. Skinner, the noted behavioural psychiatrist, lists the 20 most salient objections to behaviourism and goes on to answer them. He has answers and explanations for every one. For instance, to those who object that behaviourism "neglects innate endowment and argues that all behaviour is acquired during the lifetime of the individual," Dr. Skinner expresses puzzlement. Granted, "a few behaviourists in their enthusiasm for what may be done through the environment, have minimised or even denied genetic contribution. But others have no doubt acted as if a genetic endowment were unimportant. Few would actually contend that behaviour is endlessly malleable." And Dr. Skinner himself, sounding as often as not like some latter-day social Darwinist, gives as much weight to the 'contingencies of survival' in the evolution of the human species as to the 'contingencies of reinforcement' in the lifetime of the individual. Dr Skinner is a radical behaviourist. Radical behaviourism does not deny the possibility of self-observation or self-knowledge.

To those who claim that behaviourism "Cannot explain Creative achievements - in arts, in music, literature, science or mathematics," Dr. Skinner provides an intriguing ellipsis. "Contingencies of reinforcement also resemble contingencies of survival in the production of novelty. In both natural selection and operand conditions, the appearance of mutations is crucial. Until recently, species evolved because of random changes in genes or chromosomes, but the geneticist may arrange conditions under which mutations are particularly likely to occur. We can discover some of the sources of the new forms of behaviour which undergo selection by prevailing contingencies or reinforcement, and fortunately, the creative artist or thinker has other ways of introducing novelties."

Dr. Skinner's answers to the 20 questions he poses — questions that range all the way from investigating that behaviourism fails 'to account for cognitive processes' to wondering if behaviourism 'is indifferent to the warmth and richness of human life, and is incompatible with the enjoyment of art, music .and with love for one's fellow men,' But will it wash? Will it serve to serve those critics who have characterised Skinner variously as a mad, manipulative doctor, as a native nineteenth-century positivist, as an unscientific technician, an arrogant social engineer? There is no gainsaying that 'About Behaviourism' is an unusually compact summing up of both the history and 'the philosophy of the science of human behaviour' (as Dr. Skinner insists on defining behaviourism). It is a veritable artwork of organisation. And anyone who reads it will never again be able to think of behaviourism as simplistic philosophy that reduces human-being to black boxes responding robotlike to external stimuli.

Still, there are certain quandaries that the book does not quite dispel. For one thing, though Dr Skinner makes countless references to the advances in experiments with human beings that behaviourism has made since it first began running rats through mazes six or seven decades go, he fails to provide a single illustration of these advances. And though it may be true, as

Dr Skinner argues that one can extrapolate from pigeons to people, it would be reassuring to be shown precisely how. More important, he has not satisfactorily rebutted the basic criticism that behaviourism “is scientistic rather than scientific; it merely emulates the sciences.’ A true science doesn’t predict in advance what it will accomplish when it is firmly established as a science, not even when it is posing as ‘the philosophy of that science.’ A true science simply advances rules for testing hypothesis. But Dr Skinner predicts that behaviourism will produce the means to save human society from impending disaster. Two key concepts that keep according to that prediction are ‘manipulation’, and ‘control’. And so while he reassures us quite persuasively that science would practise those concepts benignly, one can’t shake off the suspicion that he was advancing a science just in order to save society by means of ‘manipulation’ and ‘control’, and that is not so reassuring.

The author advocates the view that:

A. a behavioural pattern is set up during the lifetime of an individual
B. there are too many chance occurrences in the lifetime of individual
C. environmental factors count much in the behaviour of human-being
D. there is an absence of genetic contribution in the science of behaviourism.

## 5.2.198 English Language: CAT 1998 | Question: 143 top

Read the following passages and answer the questions based on each.

In his book "About Behaviourism", Dr. B.F. Skinner, the noted behavioural psychiatrist, lists the 20 most salient objections to behaviourism and goes on to answer them. He has answers and explanations for every one. For instance, to those who object that behaviourism “neglects innate endowment and argues that all behaviour is acquired during the lifetime of the individual,” Dr. Skinner expresses puzzlement. Granted, “a few behaviourists in their enthusiasm for what may be done through the environment, have minimised or even denied genetic contribution. But others have no doubt acted as if a genetic endowment were unimportant. Few would actually contend that behaviour is endlessly malleable.” And Dr. Skinner himself, sounding as often as not like some latter-day social Darwinist, gives as much weight to the ‘contingencies of survival’ in the evolution of the human species as to the ‘contingencies of reinforcement’ in the lifetime of the individual. Dr Skinner is a radical behaviourist. Radical behaviourism does not deny the possibility of self-observation or self-knowledge.

To those who claim that behaviourism "Cannot explain Creative achievements - in arts, in music, literature, science or mathematics," Dr. Skinner provides an intriguing ellipsis. "Contingencies of reinforcement also resemble contingencies of survival in the production of novelty. In both natural selection and operand conditions, the appearance of mutations is crucial. Until recently, species evolved because of random changes in genes or chromosomes, but the geneticist may arrange conditions under which mutations are particularly likely to occur. We can discover some of the sources of the new forms of behaviour which undergo selection by prevailing contingencies or reinforcement, and fortunately, the creative artist or thinker has other ways of introducing novelties."

Dr. Skinner’s answers to the 20 questions he poses — questions that range all the way from investigating that behaviourism fails ‘to account for cognitive processes’ to wondering if behaviourism ‘is indifferent to the warmth and richness of human life, and is incompatible with the enjoyment of art, music .and with love for one’s fellow men,’ But will it wash? Will it serve to serve those critics who have characterised Skinner variously as a mad, manipulative doctor, as a native nineteenth-century positivist, as an unscientific technician, an arrogant social engineer? There is no gainsaying that ‘About Behaviourism’ is an unusually compact summing up of both the history and ‘the philosophy of the science of human behaviour’ (as Dr. Skinner insists on defining behaviourism). It is a veritable artwork of organisation. And anyone who reads it will never again be able to think of behaviourism as simplistic philosophy that reduces human-being to black boxes responding robotlike to external stimuli.

Still, there are certain quandaries that the book does not quite dispel. For one thing, though Dr Skinner makes countless references to the advances in experiments with human beings that behaviourism has made since it first began running rats through mazes six or seven decades go, he fails to provide a single illustration of these advances. And though it may be true, as Dr Skinner argues that one can extrapolate from pigeons to people, it would be reassuring to be shown precisely how. More important, he has not satisfactorily rebutted the basic criticism that behaviourism “is scientistic rather than scientific; it merely emulates the sciences.’ A true science doesn’t predict in advance what it will accomplish when it is firmly established as a science, not even when it is posing as ‘the philosophy of that science.’ A true science simply advances rules for testing hypothesis. But Dr Skinner predicts that behaviourism will produce the means to save human society from impending disaster. Two key concepts that keep according to that prediction are ‘manipulation’, and ‘control’. And so while he reassures us quite persuasively that science would practise those concepts benignly, one can’t shake off the suspicion that he was advancing a science just in order to save society by means of ‘manipulation’ and ‘control’, and that is not so reassuring.

Which of the following statements is true?

A. Behaviour takes different pliable forms and patterns
B. Contingencies of reinforcement play a very important part
C. Contingencies of survival play an important part as contingencies of reinforcement
D. 'There are different and novel factors of environment that contributes'.

cat1998 english-language passage-reading

## 5.2.199 English Language: CAT 1998 | Question: 144 top

Read the following passages and answer the questions based on each.

In his book "About Behaviourism", Dr. B.F. Skinner, the noted behavioural psychiatrist, lists the 20 most salient objections to behaviourism and goes on to answer them. He has answers and explanations for every one. For instance, to those who object that behaviourism “neglects innate endowment and argues that all behaviour is acquired during the lifetime of the individual,” Dr. Skinner expresses puzzlement. Granted, “a few behaviourists in their enthusiasm for what may be done through the environment, have minimised or even denied genetic contribution. But others have no doubt acted as if a genetic endowment were unimportant. Few would actually contend that behaviour is endlessly malleable.” And Dr. Skinner himself, sounding as often as not like some latter-day social Darwinist, gives as much weight to the ‘contingencies of survival’ in the evolution of the human species as to the ‘contingencies of reinforcement’ in the lifetime of the individual. Dr Skinner is a radical behaviourist. Radical behaviourism does not deny the possibility of self-observation or self-knowledge.

To those who claim that behaviourism "Cannot explain Creative achievements - in arts, in music, literature, science or mathematics," Dr. Skinner provides an intriguing ellipsis. "Contingencies of reinforcement also resemble contingencies of survival in the production of novelty. In both natural selection and operand conditions, the appearance of mutations is crucial. Until recently, species evolved because of random changes in genes or chromosomes, but the geneticist may arrange conditions under which mutations are particularly likely to occur. We can discover some of the sources of the new forms of behaviour which undergo selection by prevailing contingencies or reinforcement, and fortunately, the creative artist or thinker has other ways of introducing novelties."

Dr. Skinner’s answers to the 20 questions he poses — questions that range all the way from investigating that behaviourism fails ‘to account for cognitive processes’ to wondering if behaviourism ‘is indifferent to the warmth and richness of human life, and is incompatible with the enjoyment of art, music .and with love for one’s fellow men,’ But will it wash? Will it serve to serve those critics who have characterised Skinner variously as a mad, manipulative doctor, as a native nineteenth-century positivist, as an unscientific technician, an arrogant social engineer? There is no gainsaying that ‘About Behaviourism’ is an unusually compact summing up of both the history and ‘the philosophy of the science of human behaviour’ (as Dr. Skinner insists on defining behaviourism). It is a veritable artwork of organisation. And anyone who reads it will never again be able to think of behaviourism as simplistic philosophy that reduces human-being to black boxes responding robotlike to external stimuli.

Still, there are certain quandaries that the book does not quite dispel. For one thing, though Dr Skinner makes countless references to the advances in experiments with human beings that behaviourism has made since it first began running rats through mazes six or seven decades go, he fails to provide a single illustration of these advances. And though it may be true, as Dr Skinner argues that one can extrapolate from pigeons to people, it would be reassuring to be shown precisely how. More important, he has not satisfactorily rebutted the basic criticism that behaviourism “is scientistic rather than scientific; it merely emulates the sciences.’ A true science doesn’t predict in advance what it will accomplish when it is firmly established as a science, not even when it is posing as ‘the philosophy of that science.’ A true science simply advances rules for testing hypothesis. But Dr Skinner predicts that behaviourism will produce the means to save human society from impending disaster. Two key concepts that keep according to that prediction are ‘manipulation’, and ‘control’. And so while he reassures us quite persuasively that science would practise those concepts benignly, one can’t shake off the suspicion that he was advancing a science just in order to save society by means of ‘manipulation’ and ‘control’, and that is not so reassuring.

Which of the following is true about Radical Behaviourism?

A. it does not deny the possibility of selfobservation and its necessity
B. it give great importance to retrospection
C. it counteracts the influence of mentalism
D. tries to put an end to mentalistic explanation of behaviour.

## 5.2.200 English Language: CAT 1998 | Question: 145 top

Read the following passages and answer the questions based on each.

In his book "About Behaviourism", Dr. B.F. Skinner, the noted behavioural psychiatrist, lists the 20 most salient objections to behaviourism and goes on to answer them. He has answers and explanations for every one. For instance, to those who object that behaviourism “neglects innate endowment and argues that all behaviour is acquired during the lifetime of the individual,” Dr. Skinner expresses puzzlement. Granted, “a few behaviourists in their enthusiasm for what may be done through the environment, have minimised or even denied genetic contribution. But others have no doubt acted as if a genetic endowment were unimportant. Few would actually contend that behaviour is endlessly malleable.” And Dr. Skinner himself, sounding as often as not like some latter-day social Darwinist, gives as much weight to the ‘contingencies of survival’ in the evolution of the human species as to the ‘contingencies of reinforcement’ in the lifetime of the individual. Dr Skinner is a radical

behaviourist. Radical behaviourism does not deny the possibility of self-observation or self-knowledge.

To those who claim that behaviourism "Cannot explain Creative achievements - in arts, in music, literature, science or mathematics," Dr. Skinner provides an intriguing ellipsis. "Contingencies of reinforcement also resemble contingencies of survival in the production of novelty. In both natural selection and operand conditions, the appearance of mutations is crucial. Until recently, species evolved because of random changes in genes or chromosomes, but the geneticist may arrange conditions under which mutations are particularly likely to occur. We can discover some of the sources of the new forms of behaviour which undergo selection by prevailing contingencies or reinforcement, and fortunately, the creative artist or thinker has other ways of introducing novelties."

Dr. Skinner's answers to the 20 questions he poses — questions that range all the way from investigating that behaviourism fails 'to account for cognitive processes' to wondering if behaviourism 'is indifferent to the warmth and richness of human life, and is incompatible with the enjoyment of art, music .and with love for one's fellow men,' But will it wash? Will it serve to serve those critics who have characterised Skinner variously as a mad, manipulative doctor, as a native nineteenth-century positivist, as an unscientific technician, an arrogant social engineer? There is no gainsaying that 'About Behaviourism' is an unusually compact summing up of both the history and 'the philosophy of the science of human behaviour' (as Dr. Skinner insists on defining behaviourism). It is a veritable artwork of organisation. And anyone who reads it will never again be able to think of behaviourism as simplistic philosophy that reduces human-being to black boxes responding robotlike to external stimuli.Still, there are certain quandaries that the book does not quite dispel. For one thing, though Dr Skinner makes countless references to the advances in experiments with human beings that behaviourism has made since it first began running rats through mazes six or seven decades go, he fails to provide a single illustration of these advances. And though it may be true, as Dr Skinner argues that one can extrapolate from pigeons to people, it would be reassuring to be shown precisely how. More important, he has not satisfactorily rebutted the basic criticism that behaviourism "is scientistic rather than scientific; it merely emulates the sciences.' A true science doesn't predict in advance what it will accomplish when it is firmly established as a science, not even when it is posing as 'the philosophy of that science.' A true science simply advances rules for testing hypothesis. But Dr Skinner predicts that behaviourism will produce the means to save human society from impending disaster. Two key concepts that keep according to that prediction are 'manipulation', and 'control'. And so while he reassures us quite persuasively that science would practise those concepts benignly, one can't shake off the suspicion that he was advancing a science just in order to save society by means of 'manipulation' and 'control', and that is not so reassuring.

The passage stresses on the importance of which of the following?

A. the relationship between creativity and human achievement
B. the part played by mutations in creating novelties
C. the development of a creative artist by the influence of behaviour
D. prevailing contingencies or reinforcement selecting new forms of behaviour

## 5.2.227 English Language: CAT 1998 | Question: 41 top

Read each of the short passages given below and answer the questions that follows it.

The Kolahal party had to fight the Golmal party bitterly to win the mayoral elections. One of the main features of its campaign was that it would make public all the papers related to a scandal during the regime of the Golmal party. After the victory, however, the new mayor got busy introducing many schemes, both liked and not liked by the public. The Golmal party made only mild protests but refrained from tabling a serious no-confidence motion in the council which it could have won by obtaining the support of the independent members.

Which of the following statements, if true, implies that the Kolahal party is blackmailing the Golmal party?

A. The paper mentioned in the election campaign are prepared and ready.
B. Some members of the public disliked the reforms made by the new mayor.
C. People complained about collusion between the two parties.
D. Independent members were not keen on supporting the Golmal party.

## 5.2.228 English Language: CAT 1998 | Question: 42 top

Read each of the short passages given below and answer the questions that follows it.

Cellular phone services are being provided by two companies in each telecom circle. These companies were awarded the contracts based on the licence fees they agreed to pay the government and were selected on a competitive basis. Cellular phone service providers have found that their profits are much less than they expected - in fact in most cases they are losing money.

Which of the following can be inferred from the above passage?

A. All the cellular phone service providers have been operating inefficiently.
B. The government was wrong in allowing private provision of cellular services.
C. Cellular service providers have been unable to match performance to plan.
D. Paging services have eaten into the revenue of the cellular services.

cat1998 english-language passage-reading

## 5.2.229 English Language: CAT 1998 | Question: 43 top

Read each of the short passages given below and answer the questions that follows it.

Organisations are often defined as groups of people who come together to pursue a common goal. But more often than not, goals diverge as much as they converge, making the rationality of the overall organisation no more than an elusive ideal. Beneath the collective irrationality, however, organisations are often operating in a way that is eminently rational from the

standpoint of the individuals, groups and coalitions directly involved. Which of the following can be inferred from the above passage?

A. If all employees of an organisation pursue their individual goals, one can never have an organisation that behaves rationally.
B. Although conceptually an organisation may appear to be irrational — behaviours of individuals, groups and coalitions in the organisation may be rational.
C. As individuals, groups or coalitions in an organisation pursue their own interests, the conceptual issues of rational behaviour get blurred.
D. Since people are essentially irrational, the ideal of building a rational organisation is elusive.

cat1998 english-language passage-reading

## 5.2.230 English Language: CAT 1998 | Question: 44 top

Read each of the short passages given below and answer the questions that follows it.

BSE officials point out that ever since on-line trading took off, surveillance isn't difficult anymore. Sophisticated software has been installed for continuous monitoring of stock prices. If that is so, how could the unnatural spurt in prices of operator-driven stock go unnoticed? There does not seem to be regular checks or supervision.

Which of the following can be inferred from the above passage?

A. The software used at BSE is not as sophisticated as it is claimed to be.
B. The operators can drive stock prices crazy irrespective of the kind of software installed.
C. Nobody can ever predict how stock prices move in the market.
D. Having the infrastructure in place is one thing, but proper utilisation is another.

## 5.2.231 English Language: CAT 1998 | Question: 45 top

Read each of the short passages given below and answer the questions that follows it.

At a movie theatre in Bangalore, last year, the proprietor decided to sell about one-third of his total balcony capacity on the Internet. The response was tremendous. One every new release, the entire on-line capacity was sold out. Today, there are at least 2 million educated and well-heeled consumers in India who are ordering everything from cinema tickets to paan and tennis racquets to shirts from the comfort of their offices or homes. Which of the following can be inferred from the above passage?

A. There is a growing breed of computer-savvy consumers in Bangalore.
B. It is more comfortable to purchase movie tickets through the Internet.
C. A retailing revolution is underway in India with the advent of the Internet.
D. The proprietor of the theatre can profitably decide to sell all the balcony tickets through the Internet.

## 5.2.232 English Language: CAT 1998 | Question: 46 top

Read each of the short passages given below and answer the questions that follows it.

The dominant modern belief is that the soundest foundation of peace would be universal prosperity. One may look in vain for historical evidence that the rich have regularly been more peaceful than the poor, but it can be argued that they have never felt secure against the poor; that their aggressiveness stemmed from fear; and that the situation would be quite different if everybody were rich. It can be inferred from the above passage that:

A. Most aggression in the world stems from the desire of the haves to defend themselves against the have-nots.
B. Prosperity as foolproof measure of peace can no longer be accepted.
C. Both a and b.
D. Neither a nor b.

cat1998 english-language

## 5.2.233 English Language: CAT 1998 | Question: 47 top

Read each of the short passages given below and answer the questions that follow it.

The effect produced on the mind by travelling depends entirely on the mind of the traveller and on the way in which he conducts himself. The chief idea of one very common type of traveller is to see as many objects of interest as he possibly can. If he can only after his return home say that he has seen such and such a temple, castle, picture gallery, or museum, he is perfectly satisfied. Far different is the effect of travels upon those who leave their country with minds prepared by culture to feel intelligent admiration for all the beauties of nature and art to be found in foreign lands. When they visit a new place, instead of hurrying from temple to museum to picture gallery, they allow the spirit of the place to sink into their minds, and only visit such monuments as the time they have at their disposal allows them to contemplate without irreverent haste.

It can be inferred from the above passage that:

A. The writer prefers the second type of traveller.
B. The first type of traveller is the lay traveller who does not understand the worth of any place he travels to
C. The objective of the second type of traveller is not to see much, but to see well.
D. All of the above.

## 5.2.237 English Language: CAT 1998 | Question: 50 top

Read each of the short passages given below and answer the questions that follow it.

Aspiration is nothing new. Neither is the debate over what the Indian middle class is, what it wants and what it buys. Since the mid- 80s, that has been the focus of the economic policy papers, so called pro and anti-poor budgets and marketing strategies that have successfully broken the barrier to urban selling and reached deeper into rural India with increasing income levels and aspirations. Based on the above passage it can be inferred that

A. The Indian middle class has been the focus of economic policies for a long time.

B. The Indian middle class has graduated from being the ‘deprived’ middle class to the ‘pampered’ middle class.
C. Both a and b.
D. Neither a nor b.

### 5.2.242 English Language: CAT 1998 | Question: 96 top

Read the following passages and answer the questions based on each.

Every lover of words knows that these little symbolic units of meaning can be as contradictory as sub-atomic particles sometimes are. This may well be nature’s quixotic way of laughing at our desperate need to explain everything. It gives us a full stop, but watches helplessly, as we expand it into three dots and continue to search.

Although the measurement of the velocity of subatomic particles precludes the. measurement to their position and vice versa, it hasn’t stopped nuclear physicists from trying from searching, from attempting to pin down, to explain. And it is important.

In a book on quantum physics called In Search of Schrodinger‘s Cat, John Gribbin says something very fascinating. If a mythical god with a magical pair of infinitesimally small pliers started the task of removing one atom from a molecule of hydrogen (if I remember correctly) every second from the time of the Big Bang today, it would take another million years for him or her to complete the task. Phew!

But it is still important to try. Why? If everything is so small and the now proved quantum world is essentially indefinable, why do we go on trying to define? Because we must. It is as important to be rigorous and empirical as to accept the indefinable, Lest we forget, it is through absorption in the act of definition that we first encountered the indefinable. And it is still found there more easily than anywhere else.

But for the effort to define, how would find the indefinable? But for the setting of limits, would the notion of the limitless have ever arisen? Didn’t William Blake once remind us that we never know what is enough; unless we have known what is more

than enough.

So, when we analyse words, they are paradoxical, as anything self-referential is. whether it is the language of mathematics or the language of words, self-reference engenders paradox. But one wonders why this is a cause of concern for some people, who would prefer no shades of grey.

Words are very close to what Planck called “quanta” though they are not literally packets of meaning; they are the paradoxical verbal equivalent, “receptacles of meaning”. Little drawers if you like, into which we can insert fresh meanings that expand, limit or even contradict the accepted meaning of the word or phrase.

When we say, “I’ll believe you!” for instance, we means the exact opposite. As, indeed, when we say something is “bad” in Black American language. because it means “good”.

The original meaning of the word is like a reference point on a matrix. Good, if we use. its definition as a working hypothesis. But very dangerous, if we take it as full and final, irrevocable statement of what it sets out to describe.

Why, one may ask, give the world a meaning at all, if accepting it is suspect? And why embark on the act of definition at all if the result of the definition is insignificant?

Like many wonderful and rewarding things in this mysterious world, It is not either/or but and/plus. It is like asking why we learnt to crawl, if all we are going to do is unlearning it to walk? And further, when on occasion, we are required to crawl in later life are we regressing?

Learning is a process, not a thing. If we must look a it as a thing we must look at it as lying-sittingstanding-crawling- walking-running.

To define words, and define them exactly, is very important at the outset. When one is learning a language and even through the process of getting language and even through the process of getting familiar with it, definitions and boundaries are crucial, just as following a broad road to a place is critical before we know our way there. Once we do the rules aren’t important; once we have found a dozen shorter or pleasanter ways to the place, the highway may be of little use to us.

Once we have a certain command of the language, however, rules are meant to be broken. Particularly if we are riding the crazy roller coaster of the English language. It is then what we thought was a packet turns out to be a receptacle. In the clearer light of day, when there is less confusion and obscurity, what appeared to be a serpent in the dusty light, is now quite clearly rope.

In Alice Wonderland, Humpty Dumpty says it quite brilliantly.

"I don’t know what you mean by glory', "Alice said Humpty Dumpty smiled contemptuously.

"Of course you don’t—till I tell you. I meant there’s a nice knock-down argument for you!"

"But 'glory' doesn’t mean a nice knock-down argument’," Alice objected.

"When I use a word, " Humpty Dumpty said, in a rather sorrowful tone, "it means just what I choose it to mean — neither more nor less."

"The question is,"said Alice, "whether you can make words mean so many different things."

"The question is, "said Humpty Dumpty, "which is to be the master — that’s all."

Be that as it may, a word in your ear before the words stop. Can you ever have nice knock-down argument?

According to the passage

A. Anything delightful is paradoxical.
B. Anything self-referential is paradoxical.
C. Anything in shades of grey is paradoxical
D. Anything in a rich and fertile ground is paradoxical

cat1998 english-language passage-reading

## 5.2.243 English Language: CAT 1998 | Question: 97 top

Read the following passages and answer the questions based on each.

Every lover of words knows that these little symbolic units of meaning can be as contradictory as sub-atomic particles sometimes are. This may well be nature’s quixotic way of laughing at our desperate need to explain everything. It gives us a full stop, but watches helplessly, as we expand it into three dots and continue to search.

Although the measurement of the velocity of subatomic particles precludes the. measurement to their position and vice versa, it hasn’t stopped nuclear physicists from trying from searching, from attempting to pin down, to explain. And it is important.

In a book on quantum physics called In Search of Schrodinger‘s Cat, John Gribbin says something very fascinating. If a mythical god with a magical pair of infinitesimally small pliers started the task of removing one atom from a molecule of hydrogen (if I remember correctly) every second from the time of the Big Bang today, it would take another million years for him or her to complete the task. Phew!

But it is still important to try. Why? If everything is so small and the now proved quantum world is essentially indefinable,

why do we go on trying to define? Because we must. It is as important to be rigorous and empirical as to accept the indefinable, Lest we forget, it is through absorption in the act of definition that we first encountered the indefinable. And it is still found there more easily than anywhere else.

But for the effort to define, how would find the indefinable? But for the setting of limits, would the notion of the limitless have ever arisen? Didn't William Blake once remind us that we never know what is enough; unless we have known what is more than enough.

So, when we analyse words, they are paradoxical, as anything self-referential is. whether it is the language of mathematics or the language of words, self-reference engenders paradox. But one wonders why this is a cause of concern for some people, who would prefer no shades of grey.

Words are very close to what Planck called "quanta" though they are not literally packets of meaning; they are the paradoxical verbal equivalent, "receptacles of meaning". Little drawers if you like, into which we can insert fresh meanings that expand, limit or even contradict the accepted meaning of the word or phrase.

When we say, "I'll believe you!" for instance, we means the exact opposite. As, indeed, when we say something is "bad" in Black American language. because it means "good".

The original meaning of the word is like a reference point on a matrix. Good, if we use. its definition as a working hypothesis. But very dangerous, if we take it as full and final, irrevocable statement of what it sets out to describe.

Why, one may ask, give the world a meaning at all, if accepting it is suspect? And why embark on the act of definition at all if the result of the definition is insignificant?

Like many wonderful and rewarding things in this mysterious world, It is not either/or but and/plus. It is like asking why we learnt to crawl, if all we are going to do is unlearning it to walk? And further, when on occasion, we are required to crawl in later life are we regressing?

Learning is a process, not a thing. If we must look a it as a thing we must look at it as lying-sittingstanding-crawling- walking-running.

To define words, and define them exactly, is very important at the outset. When one is learning a language and even through the process of getting language and even through the process of getting familiar with it, definitions and boundaries are crucial, just as following a broad road to a place is critical before we know our way there. Once we do the rules aren't important; once we have found a dozen shorter or pleasanter ways to the place, the highway may be of little use to us.

Once we have a certain command of the language, however, rules are meant to be broken. Particularly if we are riding the crazy roller coaster of the English language. It is then what we thought was a packet turns out to be a receptacle. In the clearer light of day, when there is less confusion and obscurity, what appeared to be a serpent in the dusty light, is now quite clearly rope.

In Alice Wonderland, Humpty Dumpty says it quite brilliantly.

"I don't know what you mean by glory', "Alice said Humpty Dumpty smiled contemptuously.

"Of course you don't—till I tell you. I meant there's a nice knock-down argument for you!"

"But 'glory' doesn't mean a nice knock-down argument'," Alice objected.

"When I use a word, " Humpty Dumpty said, in a rather sorrowful tone, "it means just what I choose it to mean — neither more nor less."

"The question is,"said Alice, "whether you can make words mean so many different things."

"The question is, "said Humpty Dumpty, "which is to be the master — that's all."

Be that as it may, a word in your ear before the words stop. Can you ever have nice knock-down argument?

From the passage it can be inferred that:

A. To understand a system, we should investigate within its boundaries.
B. To understand a system, we should investigate beyond its boundaries.
C. To understand a system, we should be rigorous and empirical.
D. To understand a system, we should investigate both within .and beyond its boundaries.

## 5.2.244 English Language: CAT 1998 | Question: 98 top

Read the following passages and answer the questions based on each.

Every lover of words knows that these little symbolic units of meaning can be as contradictory as sub-atomic particles sometimes are. This may well be nature's quixotic way of laughing at our desperate need to explain everything. It gives us a full stop, but watches helplessly, as we expand it into three dots and continue to search.

Although the measurement of the velocity of subatomic particles precludes the. measurement to their position and vice versa, it hasn't stopped nuclear physicists from trying from searching, from attempting to pin down, to explain. And it is important.

In a book on quantum physics called In Search of Schrodinger‘s Cat, John Gribbin says something very fascinating. If a mythical god with a magical pair of infinitesimally small pliers started the task of removing one atom from a molecule of hydrogen (if I remember correctly) every second from the time of the Big Bang today, it would take another million years for him or her to complete the task. Phew!

But it is still important to try. Why? If everything is so small and the now proved quantum world is essentially indefinable, why do we go on trying to define? Because we must. It is as important to be rigorous and empirical as to accept the indefinable, Lest we forget, it is through absorption in the act of definition that we first encountered the indefinable. And it is still found there more easily than anywhere else.

But for the effort to define, how would find the indefinable? But for the setting of limits, would the notion of the limitless have ever arisen? Didn’t William Blake once remind us that we never know what is enough; unless we have known what is more than enough.

So, when we analyse words, they are paradoxical, as anything self-referential is. whether it is the language of mathematics or the language of words, self-reference engenders paradox. But one wonders why this is a cause of concern for some people, who would prefer no shades of grey.

Words are very close to what Planck called “quanta” though they are not literally packets of meaning; they are the paradoxical verbal equivalent, “receptacles of meaning”. Little drawers if you like, into which we can insert fresh meanings that expand, limit or even contradict the accepted meaning of the word or phrase.

When we say, “I’ll believe you!” for instance, we means the exact opposite. As, indeed, when we say something is “bad” in Black American language. because it means “good”.

The original meaning of the word is like a reference point on a matrix. Good, if we use. its definition as a working hypothesis. But very dangerous, if we take it as full and final, irrevocable statement of what it sets out to describe.

Why, one may ask, give the world a meaning at all, if accepting it is suspect? And why embark on the act of definition at all if the result of the definition is insignificant?

Like many wonderful and rewarding things in this mysterious world, It is not either/or but and/plus. It is like asking why we learnt to crawl, if all we are going to do is unlearning it to walk? And further, when on occasion, we are required to crawl in later life are we regressing?

Learning is a process, not a thing. If we must look a it as a thing we must look at it as lying-sittingstanding-crawling- walking-running.

To define words, and define them exactly, is very important at the outset. When one is learning a language and even through the process of getting language and even through the process of getting familiar with it, definitions and boundaries are crucial, just as following a broad road to a place is critical before we know our way there. Once we do the rules aren’t important; once we have found a dozen shorter or pleasanter ways to the place, the highway may be of little use to us.

Once we have a certain command of the language, however, rules are meant to be broken. Particularly if we are riding the crazy roller coaster of the English language. It is then what we thought was a packet turns out to be a receptacle. In the clearer light of day, when there is less confusion and obscurity, what appeared to be a serpent in the dusty light, is now quite clearly rope.

In Alice Wonderland, Humpty Dumpty says it quite brilliantly.

"I don’t know what you mean by glory', "Alice said Humpty Dumpty smiled contemptuously.

"Of course you don’t—till I tell you. I meant there’s a nice knock-down argument for you!"

"But 'glory' doesn’t mean a nice knock-down argument’," Alice objected.

"When I use a word, " Humpty Dumpty said, in a rather sorrowful tone, "it means just what I choose it to mean — neither more nor less."

"The question is,"said Alice, "whether you can make words mean so many different things."

"The question is, "said Humpty Dumpty, "which is to be the master — that’s all."

Be that as it may, a word in your ear before the words stop. Can you ever have nice knock-down argument?

According to Humpty Dumpty:

A. Alice does not know what 'glory' means.
B. He is Alice's master.
C. He imparts to a word the meaning he intends.
D. His words are ambiguous.

## 5.2.245 English Language: CAT 1998 | Question: 99 top

Read the following passages and answer the questions based on each.

Every lover of words knows that these little symbolic units of meaning can be as contradictory as sub-atomic particles sometimes are. This may well be nature’s quixotic way of laughing at our desperate need to explain everything. It gives us a

full stop, but watches helplessly, as we expand it into three dots and continue to search.

Although the measurement of the velocity of subatomic particles precludes the. measurement to their position and vice versa, it hasn't stopped nuclear physicists from trying from searching, from attempting to pin down, to explain. And it is important.

In a book on quantum physics called In Search of Schrodinger's Cat, John Gribbin says something very fascinating. If a mythical god with a magical pair of infinitesimally small pliers started the task of removing one atom from a molecule of hydrogen (if I remember correctly) every second from the time of the Big Bang today, it would take another million years for him or her to complete the task. Phew!

But it is still important to try. Why? If everything is so small and the now proved quantum world is essentially indefinable, why do we go on trying to define? Because we must. It is as important to be rigorous and empirical as to accept the indefinable, Lest we forget, it is through absorption in the act of definition that we first encountered the indefinable. And it is still found there more easily than anywhere else.

But for the effort to define, how would find the indefinable? But for the setting of limits, would the notion of the limitless have ever arisen? Didn't William Blake once remind us that we never know what is enough; unless we have known what is more than enough.

So, when we analyse words, they are paradoxical, as anything self-referential is. whether it is the language of mathematics or the language of words, self-reference engenders paradox. But one wonders why this is a cause of concern for some people, who would prefer no shades of grey.

Words are very close to what Planck called "quanta" though they are not literally packets of meaning; they are the paradoxical verbal equivalent, "receptacles of meaning". Little drawers if you like, into which we can insert fresh meanings that expand, limit or even contradict the accepted meaning of the word or phrase.

When we say, "I'll believe you!" for instance, we means the exact opposite. As, indeed, when we say something is "bad" in Black American language. because it means "good".

The original meaning of the word is like a reference point on a matrix. Good, if we use. its definition as a working hypothesis. But very dangerous, if we take it as full and final, irrevocable statement of what it sets out to describe.

Why, one may ask, give the world a meaning at all, if accepting it is suspect? And why embark on the act of definition at all if the result of the definition is insignificant?

Like many wonderful and rewarding things in this mysterious world, It is not either/or but and/plus. It is like asking why we learnt to crawl, if all we are going to do is unlearning it to walk? And further, when on occasion, we are required to crawl in later life are we regressing?

Learning is a process, not a thing. If we must look a it as a thing we must look at it as lying-sittingstanding-crawling- walking-running.

To define words, and define them exactly, is very important at the outset. When one is learning a language and even through the process of getting language and even through the process of getting familiar with it, definitions and boundaries are crucial, just as following a broad road to a place is critical before we know our way there. Once we do the rules aren't important; once we have found a dozen shorter or pleasanter ways to the place, the highway may be of little use to us.

Once we have a certain command of the language, however, rules are meant to be broken. Particularly if we are riding the crazy roller coaster of the English language. It is then what we thought was a packet turns out to be a receptacle. In the clearer light of day, when there is less confusion and obscurity, what appeared to be a serpent in the dusty light, is now quite clearly rope.

In Alice Wonderland, Humpty Dumpty says it quite brilliantly.

"I don't know what you mean by glory', "Alice said Humpty Dumpty smiled contemptuously.

"Of course you don't—till I tell you. I meant there's a nice knock-down argument for you!"

"But 'glory' doesn't mean a nice knock-down argument'," Alice objected.

"When I use a word, " Humpty Dumpty said, in a rather sorrowful tone, "it means just what I choose it to mean — neither more nor less."

"The question is,"said Alice, "whether you can make words mean so many different things."

"The question is, "said Humpty Dumpty, "which is to be the master — that's all."

Be that as it may, a word in your ear before the words stop. Can you ever have nice knock-down argument?

According to the passage:

A. When some people say 'bad', they mean the opposite.
B. God will complete the removal of all atoms from the hydrogen molecule in a million years.
C. One can simultaneously measure both the velocity and position of sub-atomic particles.
D. Planck called words 'quanta'

**Read the passage given below and answer the question that follows it.**

According to McNeill, a Brahmin priest was expected to be able to recite at least one of the Vedas. The practice was essential for several centuries when the Vedas had not yet been written down. It must have had a selective effect, since priests would have been recruited from those able or willing to memorize long passages. It must have helped in the dissemination of the work, since a memorized passage can be duplicated many times.

Which of the following can be inferred from the above passage?

A. Reciting the Vedas was a Brahmin's obligation.
B. The Vedic priest was like a recorded audio cassette.
C. McNeill studied the behaviour of Brahmin priests.
D. Vedic hymns had not been scripted.

## 5.2.253 English Language: CAT 1999 | Question: 08 top

**Read the passage given below and answer the question that follows it.**

Developed countries have made adequate provisions for social security for senior citizens. State insurers (as well as private ones) offer medicare and pension benefits to people who can no longer earn. In India, with the collapse of the joint family system, the traditional shelter of the elderly has disappeared. And the state faced with a financial crunch is not in a position to provide social security. So, it is advisable that the working population give serious thought to building a financial base for itself.

Which one of the following, if it were to happen, weakens the conclusions drawn in the above passage the most?

A. The investible income of the working population, as a proportion of its total income, will grow in the future.
B. The insurance sector is underdeveloped and trends indicate that it will be extensively privatized in the future.
C. India is on a path of development that will take it to a developed country status, with all its positive and negative implications.
D. If the working population builds a stronger financial base, there will be a revival of the joint family system.

## 5.2.254 English Language: CAT 1999 | Question: 09 top

**Read the passage given below and answer the question that follows it.**

Various studies have shown that our forested and hilly regions and, in general, areas where biodiversity — as reflected in the variety of flora — is high, are the places where poverty appears to be high. And these same areas are also the ones where educational performance seems to be poor. Therefore, it may be surmised that, even disregarding poverty status, richness in biodiversity goes hand in hand with educational backwardness.

Which one of the following statements, if true, can be said to best provide supporting evidence for the surmise mentioned in the passage?

A. In regions where there is little variety in flora, educational performance is seen to be as good as in regions with high variety in flora, where poverty levels are high.
B. Regions which show high biodiversity also exhibit poor education performance, at low levels of poverty.
C. Regions which show high biodiversity reveal high levels of poverty and poor educational performance.
D. In regions where there is low biodiversity, at all levels of poverty, educational performance is seen to be good.

## 5.2.255 English Language: CAT 1999 | Question: 10 top

**Read the passage given below and answer the question that follows it.**

Cigarettes constitute a mere 20 per cent of tobacco consumption in India, and fewer than 15 per cent of the 200 million tobacco users consume cigarettes. Yet these 15 per cent contribute nearly 90 per cent of the tax revenues to the exchequer from the tobacco sector. The punitive cigarette taxation regime has kept the tax base narrow, and reducing taxes will expand this base.

Which of the following best bolsters the conclusion that reducing duties will expand the tax base?

A. The cigarette manufacturers' association has decided to indulge in aggressive promotion.
B. There is a likelihood that tobacco consumers will shift to cigarette smoking if cigarette prices were to reduce.
C. The cigarette manufacturers are lobbying for a reduction on duties.
D. An increase in duties on non-cigarette tobacco may lead to a shift in favour of cigarette smoking.

## 5.2.256 English Language: CAT 1999 | Question: 11 top

**Read the passage given below and answer the question that follows it.**

Thomas Malthus, the British clergyman-turned economist, predicted that the planet would not be able to support the human population for long. His explanation was that human population grows at a geometric rate, while the food supply grows only at an arithmetic rate.

Which one of the following, if true, would not undermine the thesis offered by Malthus?

A. Population growth can be slowed down by the voluntary choices of individuals and not just by natural disasters.
B. The capacity of the planet to feed a growing human population can be enhanced through biotechnological means.
C. Human systems, and natural systems like food supply, follow natural laws of growth which have remained constant, and will remain unchanged.
D. Human beings can colonize other planetary systems on a regular and ongoing basis to accommodate a growing population.

## 5.2.257 English Language: CAT 1999 | Question: 12 top

**Read the passage given below and answer the question that follows it.**

The company's coffee crop for $1998-99$ totalled $8,079$ tonnes, an all-time record. The increase over the previous year's production of $5,830$ tonnes was 38.58 percent. The previous highest crop was $6,089$ tonnes in $1970-71$. The company had fixed a target of $8,000$ tonnes to be realized by the year $2000-01$, and this has been achieved two years earlier, thanks to the emphasis laid on the key areas of irrigation, replacement of unproductive coffee bushes, intensive refilling and improved agricultural practices. It is now our endeavour to reach the target of $10,000$ tonnes in $2001-02$.

Which one of the following would contribute most to making the target of $10,000$ tonnes in $2001-02$ unrealistic?

A. The potential of the productivity enhancing measures implemented up to now has been exhausted.
B. The total company land under coffee has remained constant since 1969 when an estate in the Nilgiri Hills was acquired.
C. The sensitivity of the crop to climatic factors makes predictions about production uncertain.
D. The target-setting procedures in the company had been proved to be sound by the achievement of the $8,000$ tonnes target.

## 5.2.258 English Language: CAT 1999 | Question: 13 top

Read the passage given below and answer the question that follows it.

Animals, in general, are shrewd in proportion as they cultivate society. Elephants and beavers show the greatest signs of this sagacity when they are together in large numbers, but when man invades their communities they lose all their spirit of industry.

Among insects, the labours of the bee and the ant have attracted the attention and admiration of naturalists, but all their sagacity seems to be lost upon separation, and a single bee or ant seems destitute of every degree of industry. It becomes the most stupid insect imaginable, and it languishes and soon dies.

Which of the following can be inferred from the above passage?

A. Humankind is responsible for the destruction of the natural habitat of animals and insects.
B. Animals, in general, are unable to function effectively outside their normal social environment.
C. Naturalists have great admiration for bees and ants, despite their lack of industry upon separation.
D. Elephants and beavers are smarter than bees and ants in the presence of human beings.

## 5.2.259 English Language: CAT 1999 | Question: 14 top

**For the question, indicates which of the statements given with that particular question is consistent with the description of the unreasonable man in the passage below.**
Unseasonableness is a tendency to do socially permissible things at the wrong time. The unseasonable man is the sort of person who comes to confide in you when you are busy. He serenades his beloved when she is ill. He asks a man who has just lost money by paying a bill for a friend to pay a bill for him. He invites a friend to go for a ride just after the friend has finished a long car trip. He is eager to offer services which are not wanted, but which cannot be politely refused. If he is present at an arbitration, he stirs up dissension between the two parties, who were really anxious to agree. Such is the unseasonable man.
He tends to

A. entertain women.
B. be a successful arbitrator when dissenting parties are anxious to agree.
C. be helpful when solicited.
D. tell a long story to people who have heard it many times before.

## 5.2.269 English Language: CAT 1999 | Question: 24 top

**Read the passage and answer the questions:**

The World Trade Organization (WTO) was formed in the early 1990s as a component of the Uruguay Round negotiation. However, it could have been negotiated as part of the Tokyo Round of the 1970s, since that negotiation was an attempt at a 'constitutional reform' of the General Agreement on Tariffs and Trade (GATT). Or it could have been put off to the future, as the US Government wanted. What factors led to the creation of the WTO in the early 1990s?

One factor was the pattern of multilateral bargaining that developed late in the Uruguay Round. Like all complex international agreements, the WTO was a product of a series of trade-offs between principal actors and groups. For the United States, which did not want a new organization, the dispute settlement part of the WTO package achieved its longstanding goal of a more effective and more legal dispute settlement system. For the Europeans, who by the 1990s had come to view GATT dispute settlement less in political terms and more as a regime of legal obligations, the WTO package was acceptable as a means to discipline the resort to unilateral measures by the United States. Countries like Canada and other middle and smaller trading partners were attracted by the expansion of a rules-based system and by the symbolic value of a trade organization, both of which inherently support the weak against the strong. The developing countries were attracted due to the provisions banning unilateral measures. Finally, and perhaps most important, many countries at the Uruguay Round came to put a higher priority on the export gains than on the import losses that the negotiation would produce, and they came to associate the WTO and a rules-based system with those gains. This reasoning — replicated in many countries — was contained in US Ambassador Kantor's defence of the WTO, and it amounted to a recognition that international trade and its benefits cannot be enjoyed unless trading nations accept the discipline of a negotiated rules-based environment.

A second factor in the creation of the WTO was pressure from lawyers and the legal process. The dispute settlement system of the WTO was seen as a victory of legalists over pragmatists but the matter went deeper than that. The GATT, and the WTO, are contract organizations based on rules, and it is inevitable that an organization created to further rules will in turn be influenced by the legal process. Robert Hudec has written of the 'momentum of legal development', but what is this precisely? Legal development can be defined as promotion of the technical legal values of consistency, clarity (or, certainty) and effectiveness: these are values that those responsible for administering any legal system will seek to maximize. As it played out in the WTO, consistency meant integrating under one roof the whole lot of separate agreements signed under GATT auspices; clarity meant removing ambiguities about the powers of contracting parties to make certain decisions or to undertake waivers: and effectiveness meant eliminating exceptions arising out of grandfather-rights and resolving defects in dispute settlement

procedures and institutional provisions. Concern for these values is inherent in any rules-based system of cooperation, since without these values, rules would be meaningless in the first place. Rules, therefore, create their own incentive for fulfilment.

The momentum of legal development has occurred in other institutions besides the GATT, most notably in the European Union (EU). Over the past two decades the European Court of Justice (ECJ) has consistently rendered decisions that have expanded incrementally the EU's internal market, in which the doctrine of 'mutual recognition' handed down in the case Cassis de Dijon in 1979 was a key turning point. The court is now widely recognized as a major player in European integration, even though arguably such a strong role was not originally envisaged in the Treaty of Rome, which initiated the current European Union. One means the court used to expand integration was the 'teleological method of interpretation', whereby the actions of member states were evaluated against 'the accomplishment of the most elementary community goals set forth in the Preamble to the [Rome] Treaty'. The teleological method represents an effort to keep current policies consistent with stated goals, and it is analogous to the effort in GATT to keep contracting party trade practices consistent with stated rules. In both cases legal concerns and procedures are an independent force for further cooperation.

In large part, the WTO was an exercise in consolidation. In the context of a trade negotiation that created a near-revolutionary expansion of international trade rules, the formation of the WTO was a deeply conservative act needed to ensure that the benefits of the new rules would not be lost. The WTO was all about institutional structure and dispute settlement: these are the concerns of conservatives and not revolutionaries, which is why lawyers and legalists took the lead on these issues. The WTO codified the GATT institutional practice that had developed by custom over three decades, and it incorporated a new dispute settlement system that was necessary to keep both old and new rules from becoming a sham. Both the international structure and the dispute settlement system were necessary to preserve and enhance the integrity of the multilateral trade regime that had been built incrementally from the 1940s to the 1990s.

What could be the closest reason why the WTO was not formed in the 1970s?

A. The US government did not like it.
B. Important players did not find it in their best interest to do so.
C. Lawyers did not work for the dispute settlement system.
D. The Tokyo Round negotiation was an attempt at constitutional reform.

## 5.2.270 English Language: CAT 1999 | Question: 25 top

**Read the passage and answer the questions:**

The World Trade Organization (WTO) was formed in the early 1990s as a component of the Uruguay Round negotiation. However, it could have been negotiated as part of the Tokyo Round of the 1970s, since that negotiation was an attempt at a 'constitutional reform' of the General Agreement on Tariffs and Trade (GATT). Or it could have been put off to the future, as the US Government wanted. What factors led to the creation of the WTO in the early 1990s?

One factor was the pattern of multilateral bargaining that developed late in the Uruguay Round. Like all complex international agreements, the WTO was a product of a series of trade-offs between principal actors and groups. For the United States, which did not want a new organization, the dispute settlement part of the WTO package achieved its longstanding goal of a more effective and more legal dispute settlement system. For the Europeans, who by the 1990s had come to view GATT dispute settlement less in political terms and more as a regime of legal obligations, the WTO package was acceptable as a means to discipline the resort to unilateral measures by the United States. Countries like Canada and other middle and smaller trading partners were attracted by the expansion of a rules-based system and by the symbolic value of a trade organization, both of which inherently support the weak against the strong. The developing countries were attracted due to the provisions banning unilateral measures. Finally, and perhaps most important, many countries at the Uruguay Round came to put a higher priority on the export gains than on the import losses that the negotiation would produce, and they came to associate the WTO and a rules-based system with those gains. This reasoning — replicated in many countries — was contained in US Ambassador Kantor's defence of the WTO, and it amounted to a recognition that international trade and its benefits cannot be enjoyed unless trading nations accept the discipline of a negotiated rules-based environment.

A second factor in the creation of the WTO was pressure from lawyers and the legal process. The dispute settlement system of the WTO was seen as a victory of legalists over pragmatists but the matter went deeper than that. The GATT, and the WTO, are contract organizations based on rules, and it is inevitable that an organization created to further rules will in turn be influenced by the legal process. Robert Hudec has written of the 'momentum of legal development', but what is this precisely? Legal development can be defined as promotion of the technical legal values of consistency, clarity (or, certainty) and effectiveness: these are values that those responsible for administering any legal system will seek to maximize. As it played out in the WTO, consistency meant integrating under one roof the whole lot of separate agreements signed under GATT auspices; clarity meant removing ambiguities about the powers of contracting parties to make certain decisions or to undertake waivers: and effectiveness meant eliminating exceptions arising out of grandfather-rights and resolving defects in dispute settlement procedures and institutional provisions. Concern for these values is inherent in any rules-based system of cooperation, since without these values, rules would be meaningless in the first place. Rules, therefore, create their own incentive for fulfilment.

The momentum of legal development has occurred in other institutions besides the GATT, most notably in the European Union

(EU). Over the past two decades the European Court of Justice (ECJ) has consistently rendered decisions that have expanded incrementally the EU's internal market, in which the doctrine of 'mutual recognition' handed down in the case Cassis de Dijon in 1979 was a key turning point. The court is now widely recognized as a major player in European integration, even though arguably such a strong role was not originally envisaged in the Treaty of Rome, which initiated the current European Union. One means the court used to expand integration was the 'teleological method of interpretation', whereby the actions of member states were evaluated against 'the accomplishment of the most elementary community goals set forth in the Preamble to the [Rome] Treaty'. The teleological method represents an effort to keep current policies consistent with stated goals, and it is analogous to the effort in GATT to keep contracting party trade practices consistent with stated rules. In both cases legal concerns and procedures are an independent force for further cooperation.

In large part, the WTO was an exercise in consolidation. In the context of a trade negotiation that created a near-revolutionary expansion of international trade rules, the formation of the WTO was a deeply conservative act needed to ensure that the benefits of the new rules would not be lost. The WTO was all about institutional structure and dispute settlement: these are the concerns of conservatives and not revolutionaries, which is why lawyers and legalists took the lead on these issues. The WTO codified the GATT institutional practice that had developed by custom over three decades, and it incorporated a new dispute settlement system that was necessary to keep both old and new rules from becoming a sham. Both the international structure and the dispute settlement system were necessary to preserve and enhance the integrity of the multilateral trade regime that had been built incrementally from the 1940s to the 1990s.

The most likely reason for the acceptance of the WTO package by nations was that

A. it had the means to prevent the US from taking unilateral measures.
B. they recognized the need for a rule-based environment to protect the benefits of increased trade.
C. it settles disputes more legally and more effectively.
D. its rule-based system leads to export gains.

Robert Hudec has written of the 'momentum of legal development', but what is this precisely? Legal development can be defined as promotion of the technical legal values of consistency, clarity (or, certainty) and effectiveness: these are values that those responsible for administering any legal system will seek to maximize. As it played out in the WTO, consistency meant integrating under one roof the whole lot of separate agreements signed under GATT auspices; clarity meant removing ambiguities about the powers of contracting parties to make certain decisions or to undertake waivers: and effectiveness meant eliminating exceptions arising out of grandfather-rights and resolving defects in dispute settlement procedures and institutional provisions. Concern for these values is inherent in any rules-based system of cooperation, since without these values, rules would be meaningless in the first place. Rules, therefore, create their own incentive for fulfilment.

The momentum of legal development has occurred in other institutions besides the GATT, most notably in the European Union (EU). Over the past two decades the European Court of Justice (ECJ) has consistently rendered decisions that have expanded incrementally the EU's internal market, in which the doctrine of 'mutual recognition' handed down in the case Cassis de Dijon in 1979 was a key turning point. The court is now widely recognized as a major player in European integration, even though arguably such a strong role was not originally envisaged in the Treaty of Rome, which initiated the current European Union. One means the court used to expand integration was the 'teleological method of interpretation', whereby the actions of member states were evaluated against 'the accomplishment of the most elementary community goals set forth in the Preamble to the [Rome] Treaty'. The teleological method represents an effort to keep current policies consistent with stated goals, and it is analogous to the effort in GATT to keep contracting party trade practices consistent with stated rules. In both cases legal concerns and procedures are an independent force for further cooperation.

In large part, the WTO was an exercise in consolidation. In the context of a trade negotiation that created a near-revolutionary expansion of international trade rules, the formation of the WTO was a deeply conservative act needed to ensure that the benefits of the new rules would not be lost. The WTO was all about institutional structure and dispute settlement: these are the

concerns of conservatives and not revolutionaries, which is why lawyers and legalists took the lead on these issues. The WTO codified the GATT institutional practice that had developed by custom over three decades, and it incorporated a new dispute settlement system that was necessary to keep both old and new rules from becoming a sham. Both the international structure and the dispute settlement system were necessary to preserve and enhance the integrity of the multilateral trade regime that had been built incrementally from the 1940s to the 1990s.

In the statement " . . . it amounted to a recognition that international trade and its benefits cannot be enjoyed unless trading nations accept the discipline of a negotiated rules-based environment", 'it' refers to

A. Ambassador Kantor's defence of the WTO.
B. the higher priority on export gains placed by many countries at the Uruguay Round.
C. the export gains many countries came to associate with a rule-based system.
D. the provision of a rule-based system by the WTO.

## 5.2.274 English Language: CAT 1999 | Question: 29 top

**Read the passage and answer the questions:**

The World Trade Organization (WTO) was formed in the early 1990s as a component of the Uruguay Round negotiation. However, it could have been negotiated as part of the Tokyo Round of the 1970s, since that negotiation was an attempt at a 'constitutional reform' of the General Agreement on Tariffs and Trade (GATT). Or it could have been put off to the future, as the US Government wanted. What factors led to the creation of the WTO in the early 1990s?

One factor was the pattern of multilateral bargaining that developed late in the Uruguay Round. Like all complex international agreements, the WTO was a product of a series of trade-offs between principal actors and groups. For the United States, which did not want a new organization, the dispute settlement part of the WTO package achieved its longstanding goal of a more effective and more legal dispute settlement system. For the Europeans, who by the 1990s had come to view GATT dispute settlement less in political terms and more as a regime of legal obligations, the WTO package was acceptable as a means to discipline the resort to unilateral measures by the United States. Countries like Canada and other middle and smaller trading partners were attracted by the expansion of a rules-based system and by the symbolic value of a trade organization, both of which inherently support the weak against the strong. The developing countries were attracted due to the provisions banning unilateral measures. Finally, and perhaps most important, many countries at the Uruguay Round came to put a higher priority on the export gains than on the import losses that the negotiation would produce, and they came to associate the WTO and a rules-based system with those gains. This reasoning — replicated in many countries — was contained in US Ambassador Kantor's defence of the WTO, and it amounted to a recognition that international trade and its benefits cannot be enjoyed unless trading nations accept the discipline of a negotiated rules-based environment.

A second factor in the creation of the WTO was pressure from lawyers and the legal process. The dispute settlement system of the WTO was seen as a victory of legalists over pragmatists but the matter went deeper than that. The GATT, and the WTO, are contract organizations based on rules, and it is inevitable that an organization created to further rules will in turn be influenced by the legal process. Robert Hudec has written of the 'momentum of legal development', but what is this precisely? Legal development can be defined as promotion of the technical legal values of consistency, clarity (or, certainty) and effectiveness: these are values that those responsible for administering any legal system will seek to maximize. As it played out in the WTO, consistency meant integrating under one roof the whole lot of separate agreements signed under GATT auspices; clarity meant removing ambiguities about the powers of contracting parties to make certain decisions or to undertake waivers: and effectiveness meant eliminating exceptions arising out of grandfather-rights and resolving defects in dispute settlement procedures and institutional provisions. Concern for these values is inherent in any rules-based system of cooperation, since without these values, rules would be meaningless in the first place. Rules, therefore, create their own incentive for fulfilment.

The momentum of legal development has occurred in other institutions besides the GATT, most notably in the European Union (EU). Over the past two decades the European Court of Justice (ECJ) has consistently rendered decisions that have expanded incrementally the EU's internal market, in which the doctrine of 'mutual recognition' handed down in the case Cassis de Dijon in 1979 was a key turning point. The court is now widely recognized as a major player in European integration, even though arguably such a strong role was not originally envisaged in the Treaty of Rome, which initiated the current European Union. One means the court used to expand integration was the 'teleological method of interpretation', whereby the actions of member states were evaluated against 'the accomplishment of the most elementary community goals set forth in the Preamble to the [Rome] Treaty'. The teleological method represents an effort to keep current policies consistent with stated goals, and it is analogous to the effort in GATT to keep contracting party trade practices consistent with stated rules. In both cases legal concerns and procedures are an independent force for further cooperation.

In large part, the WTO was an exercise in consolidation. In the context of a trade negotiation that created a near-revolutionary expansion of international trade rules, the formation of the WTO was a deeply conservative act needed to ensure that the benefits of the new rules would not be lost. The WTO was all about institutional structure and dispute settlement: these are the concerns of conservatives and not revolutionaries, which is why lawyers and legalists took the lead on these issues. The WTO codified the GATT institutional practice that had developed by custom over three decades, and it incorporated a new dispute settlement system that was necessary to keep both old and new rules from becoming a sham. Both the international structure

and the dispute settlement system were necessary to preserve and enhance the integrity of the multilateral trade regime that had been built incrementally from the 1940s to the 1990s.

The importance of Cassis de Dijon is that it

A. gave a new impetus to the momentum of legal development at the European Court of Justice.
B. resulted in a decision that expanded incrementally the EU's internal market.
C. strengthened the role of the court more than envisaged in the Treaty of Rome.
D. led to a doctrine that was a key turning point in European integration.

## 5.2.275 English Language: CAT 1999 | Question: 30 top

**Read the passage and answer the questions:**

Have you ever come across a painting, by Picasso, Mondrian, Miro, or any other modern abstract painter of this century, and found yourself engulfed in a brightly-coloured canvas which your senses cannot interpret? Many people would tend to denounce abstractionism as senseless trash. These people are disoriented by Miro's bright, fanciful creatures and two-dimensional canvases. They click their tongues and shake their heads at Mondrian's grid works, declaring that the poor guy played too many scrabble games. They silently shake their heads in sympathy for Picasso, whose gruesome, distorted figures must be a reflection of his mental health. Then, standing in front of a work by Charlie Russell, the famous western artist, they'll declare it a work of God. People feel more comfortable with something they can relate to and understand immediately without too much thought. This is the case with the work of Charlie Russell. Being able to recognize the elements in his paintings — trees, horses and cowboys — gives people a safety line to their world of 'reality'. There are some who would disagree when I say abstract art requires more creativity and artistic talent to produce a good piece than does representational art, but there are many weaknesses in their arguments.

People who look down on abstract art have several major arguments to support their beliefs. They feel that artists turn abstract because they are not capable of the technical drafting skills that appear in a Russell: therefore, such artists create an art form that anyone is capable of and that is less time consuming, and then parade it as artistic progress. Secondly, they feel that the purpose of art is to create something of beauty in an orderly, logical composition. Russell's compositions are balanced and rational: everything sits calmly on the canvas, leaving the viewer satisfied that he has seen all there is to see. The modern abstractionists, on the other hand, seem to compose their pieces irrationally. For example, upon seeing Picasso's Guernica, a friend of mine asked me, "What's the point?" Finally, many people feel that art should portray the ideal and real. The exactness of detail in Charlie Russell's work is an example of this. He has been called a great historian because his pieces depict the lifestyle, dress, and events of the times. His subject matter is derived from his own experiences on the trial, and reproduced to the smallest detail.

I agree in part with many of these arguments, and at one time even endorsed them. But now, I believe differently. Firstly, I object to the argument that abstract artists are not capable of drafting. Many abstract artists, such as Picasso, are excellent draftsmen. As his work matured, Picasso became more abstract in order to increase the expressive quality of his work. Guernica was meant as a protest against the bombing of that city by the Germans. To express the terror and suffering of the victims more vividly, he distorted the figures and presented them in a black and white journalistic manner. If he had used representational images and colour, much of the emotional content would have been lost and the piece would not have caused the demand for justice that it did. Secondly, I do not think that a piece must be logical and aesthetically pleasing to be art. The message it conveys to its viewers is more important. It should reflect the ideals and issues of its time and be true to itself, not just a flowery, glossy surface. For example, through his work, Mondrian was trying to present a system of simplicity, logic, and rational order. As a result, his pieces did end up looking like a scrabble board. Miro created powerful, surrealistic images from his dreams and subconscious. These artists were trying to evoke a response from society through an expressionistic manner. Finally, abstract artists and epresentational artists maintain different ideas about 'reality'. To the representational artist, reality is what he sees with his eyes. This is the reality he reproduces on canvas. To the abstract artist, reality is what he feels about what his eyes see. This is the reality he interprets on canvas. This can be illustrated by Mondrian's Trees series. You can actually see the progression from the early recognizable, though abstracted Trees, to his final solution, the grid system.

A cycle of abstract and representational art began with the first scratchings of prehistoric man. From the abstractions of ancient Egypt to representational, classical Rome, returning to abstractionism in early Christian art and, so on up to the present day, the cycle has been going on. But this day and age may witness its death through the camera. With film, there is no need to produce finely detailed, historical records manually; the camera does this for us more efficiently. Maybe, representational art would cease to exist. With abstractionism as the victor of the first battle, maybe, a different kind of cycle will be touched off. Possibly, some time in the distant future, thousands of years from now, art itself will be physically non-existent. Some artists today believe that once they have planned and constructed a piece in their mind, there is no sense in finishing it with their hands; it has already been done and can never be duplicated.

The author argues that many people look down upon abstract art because they feel that

A. modern abstract art does not portray what is ideal and real.
B. abstract artists are unskilled in matters of technical drafting.

C. abstractionists compose irrationally.
D. All of the above

## 5.2.279 English Language: CAT 1999 | Question: 34 top

**Read the passage and answer the questions:**

Have you ever come across a painting, by Picasso, Mondrian, Miro, or any other modern abstract painter of this century, and found yourself engulfed in a brightly-coloured canvas which your senses cannot interpret? Many people would tend to denounce abstractionism as senseless trash. These people are disoriented by Miro's bright, fanciful creatures and two-dimensional canvases. They click their tongues and shake their heads at Mondrian's grid works, declaring that the poor guy played too many scrabble games. They silently shake their heads in sympathy for Picasso, whose gruesome, distorted figures must be a reflection of his mental health. Then, standing in front of a work by Charlie Russell, the famous western artist, they'll declare it a work of God. People feel more comfortable with something they can relate to and understand immediately

without too much thought. This is the case with the work of Charlie Russell. Being able to recognize the elements in his paintings — trees, horses and cowboys — gives people a safety line to their world of 'reality'. There are some who would disagree when I say abstract art requires more creativity and artistic talent to produce a good piece than does representational art, but there are many weaknesses in their arguments.

People who look down on abstract art have several major arguments to support their beliefs. They feel that artists turn abstract because they are not capable of the technical drafting skills that appear in a Russell: therefore, such artists create an art form that anyone is capable of and that is less time consuming, and then parade it as artistic progress. Secondly, they feel that the purpose of art is to create something of beauty in an orderly, logical composition. Russell's compositions are balanced and rational: everything sits calmly on the canvas, leaving the viewer satisfied that he has seen all there is to see. The modern abstractionists, on the other hand, seem to compose their pieces irrationally. For example, upon seeing Picasso's Guernica, a friend of mine asked me, "What's the point?" Finally, many people feel that art should portray the ideal and real. The exactness of detail in Charlie Russell's work is an example of this. He has been called a great historian because his pieces depict the lifestyle, dress, and events of the times. His subject matter is derived from his own experiences on the trial, and reproduced to the smallest detail.

I agree in part with many of these arguments, and at one time even endorsed them. But now, I believe differently. Firstly, I object to the argument that abstract artists are not capable of drafting. Many abstract artists, such as Picasso, are excellent draftsmen. As his work matured, Picasso became more abstract in order to increase the expressive quality of his work. Guernica was meant as a protest against the bombing of that city by the Germans. To express the terror and suffering of the victims more vividly, he distorted the figures and presented them in a black and white journalistic manner. If he had used representational images and colour, much of the emotional content would have been lost and the piece would not have caused the demand for justice that it did. Secondly, I do not think that a piece must be logical and aesthetically pleasing to be art. The message it conveys to its viewers is more important. It should reflect the ideals and issues of its time and be true to itself, not just a flowery, glossy surface. For example, through his work, Mondrian was trying to present a system of simplicity, logic, and rational order. As a result, his pieces did end up looking like a scrabble board. Miro created powerful, surrealistic images from his dreams and subconscious. These artists were trying to evoke a response from society through an expressionistic manner. Finally, abstract artists and epresentational artists maintain different ideas about 'reality'. To the representational artist, reality is what he sees with his eyes. This is the reality he reproduces on canvas. To the abstract artist, reality is what he feels about what his eyes see. This is the reality he interprets on canvas. This can be illustrated by Mondrian's Trees series. You can actually see the progression from the early recognizable, though abstracted Trees, to his final solution, the grid system.

A cycle of abstract and representational art began with the first scratchings of prehistoric man. From the abstractions of ancient Egypt to representational, classical Rome, returning to abstractionism in early Christian art and, so on up to the present day, the cycle has been going on. But this day and age may witness its death through the camera. With film, there is no need to produce finely detailed, historical records manually; the camera does this for us more efficiently. Maybe, representational art would cease to exist. With abstractionism as the victor of the first battle, maybe, a different kind of cycle will be touched off. Possibly, some time in the distant future, thousands of years from now, art itself will be physically non-existent. Some artists today believe that once they have planned and constructed a piece in their mind, there is no sense in finishing it with their hands; it has already been done and can never be duplicated.

The main difference between the abstract artist and the representational artist in matter of the 'ideal' and the 'real', according to the author, is

A. how each chooses to deal with 'reality' on his or her canvas.
B. the superiority of interpretation of reality over production of reality.
C. the different values attached by each to being a historian.
D. the varying levels of drafting skills and logical thinking abilities.

## 5.2.280 English Language: CAT 1999 | Question: 36 top

**Read the passage and answer the question:**

Each one has his reasons: for one, art is a flight; for another, a means of conquering. But one can flee into a hermitage, into madness, into death. One can conquer by arms. Why does it have to be writing? Because, behind the various aims of authors, there is a deeper and more immediate choice which is common to all of us. We shall try to elucidate this choice, and we shall see whether it is not in the name of this very choice of writing that the engagement of writers must be required.

Each of our perceptions is accompanied by the consciousness that human reality is a 'revealer'. That is, it is through human reality that 'there is' being , or, to put it differently, that man is the means by which things are manifested. It is our presence in the world which multiplies relations. It is we who set up a relationship between this tree and that bit of sky. Thanks to us, that star which has been dead for millennia, that quarter moon, and that dark river are disclosed in the unity of a landscape. It is the speed of our auto and our airplane which organizes the great masses of the earth. With each of our acts, the world reveals to us a new face. But, if we know that we are directors of being, we also know that we are not its producers. If we turn away from this landscape, it will sink back into its dark permanence. At least, it will sink back: there is no one mad enough to think that it

is going to be annihilated. It is we who shall be annihilated, and the earth will remain in its lethargy until another consciousness comes along to awaken it. Thus, to our inner certainty of being 'revealers' is added that of being inessential in relation to the thing revealed.

One of the chief motives of artistic creation is certainly the need of feeling that we are essential in relationship to the world. If I fix on canvas or in writing a certain aspect of the fields or the sea or a look on someone's face which I have disclosed, I am conscious of having produced them by condensing relationships, by introducing order where there was none, by imposing the unity of mind on the diversity of things. That is, I think myself essential in relation to my creation. But this time it is the created object which escapes me; I cannot reveal and produce at the same time. The creation becomes inessential in relation to the creative activity. First of all, even if it appears to others as definitive, the created object always seems to us in a state of suspension; we can always change this line, that shade, that word. Thus, it never forces itself . A novice painter asked his teacher, 'When should I consider my painting finished'? And the teacher answered, "When you can look at it in amazement and say to yourself 'I'm the one who did that!"

Which amounts to saying 'never'. For, it is virtually considering one's work with someone else's eyes and revealing what has been created. But it is self-evident that we are proportionally less conscious of the thing produced and more conscious of our productive activity. When it is a matter of poetry or carpentry, we work according to traditional norms, with tools whose usage is codified; it is Heidegger's famous 'they' who are working with our hands. In this case, the result can seem to us sufficiently strange to preserve its objectivity in our eyes. But if we ourselves produce the rules of production, the measures, the criteria, and if our creative drive comes from the very depths of our heart, then we never find anything but ourselves in our work. It is we who have invented the laws by which we judge it, it is our history, our love, our gaiety that we recognize in it. Even if we should regard it without touching it any further, we never receive from it that gaiety or love. We put them into it. The results which we have obtained on canvas or paper never seem to us objective. We are too familiar with the processes of which they are the effects. These processes remain a subjective discovery: they are ourselves, our inspiration, our ruse, and when we seek to perceive our work, we create it again, we repeat mentally the operations which produced it; each of its aspects appears as a result. Thus, in the perception, the object is given as the essential thing and the subject as the inessential. The latter seeks essential in the creation and obtains it, but then it is the object which becomes the inessential.

The dialectic is nowhere more apparent than in the art of writing, for the literary object is a peculiar top which exists only in movement. To make it come into view a concrete act called reading is necessary, and it lasts only as long as this act can last. Beyond that, there are only black marks on paper. Now, the writer cannot read what he writes, whereas the shoemaker can put on the shoes he has just made if they are of his size, and the architect can live in the house he has built. In reading, one foresees: one waits. He foresees the end of the sentence, the following sentence, the next page. He waits for them to confirm or disappoint his foresights. The reading is composed of a host of hypotheses, followed by awakenings, of hopes and deceptions. Readers are always ahead of the sentence they are reading in a merely probable future which partly collapses and partly comes together in proportion as they progress, which withdraws from one page to the next and forms the moving horizon of the literary object. Without waiting, without a future, without ignorance, there is no objectivity.

It is the author's contention that

A. artistic creations are results of human consciousness.
B. the very act of artistic creation leads to the escape of the created object.
C. man can produce and reveal at the same time.
D. an act of creation forces itself on our consciousness leaving us full of amazement.

## 5.2.282 English Language: CAT 1999 | Question: 38 top

**Read the passage and answer the question:**

Each one has his reasons: for one, art is a flight; for another, a means of conquering. But one can flee into a hermitage, into madness, into death. One can conquer by arms. Why does it have to be writing? Because, behind the various aims of authors, there is a deeper and more immediate choice which is common to all of us. We shall try to elucidate this choice, and we shall see whether it is not in the name of this very choice of writing that the engagement of writers must be required.

Each of our perceptions is accompanied by the consciousness that human reality is a 'revealer'. That is, it is through human reality that 'there is' being , or, to put it differently, that man is the means by which things are manifested. It is our presence in the world which multiplies relations. It is we who set up a relationship between this tree and that bit of sky. Thanks to us, that star which has been dead for millennia, that quarter moon, and that dark river are disclosed in the unity of a landscape. It is the speed of our auto and our airplane which organizes the great masses of the earth. With each of our acts, the world reveals to us a new face. But, if we know that we are directors of being, we also know that we are not its producers. If we turn away from this landscape, it will sink back into its dark permanence. At least, it will sink back: there is no one mad enough to think that it is going to be annihilated. It is we who shall be annihilated, and the earth will remain in its lethargy until another consciousness comes along to awaken it. Thus, to our inner certainty of being 'revealers' is added that of being inessential in relation to the thing revealed.

One of the chief motives of artistic creation is certainly the need of feeling that we are essential in relationship to the world. If I fix on canvas or in writing a certain aspect of the fields or the sea or a look on someone's face which I have disclosed, I am conscious of having produced them by condensing relationships, by introducing order where there was none, by imposing the unity of mind on the diversity of things. That is, I think myself essential in relation to my creation. But this time it is the created object which escapes me; I cannot reveal and produce at the same time. The creation becomes inessential in relation to the creative activity. First of all, even if it appears to others as definitive, the created object always seems to us in a state of suspension; we can always change this line, that shade, that word. Thus, it never forces itself . A novice painter asked his teacher, 'When should I consider my painting finished'? And the teacher answered, "When you can look at it in amazement and say to yourself 'I'm the one who did that!"

Which amounts to saying 'never'. For, it is virtually considering one's work with someone else's eyes and revealing what has

been created. But it is self-evident that we are proportionally less conscious of the thing produced and more conscious of our productive activity. When it is a matter of poetry or carpentry, we work according to traditional norms, with tools whose usage is codified; it is Heidegger's famous 'they' who are working with our hands. In this case, the result can seem to us sufficiently strange to preserve its objectivity in our eyes. But if we ourselves produce the rules of production, the measures, the criteria, and if our creative drive comes from the very depths of our heart, then we never find anything but ourselves in our work. It is we who have invented the laws by which we judge it, it is our history, our love, our gaiety that we recognize in it. Even if we should regard it without touching it any further, we never receive from it that gaiety or love. We put them into it. The results which we have obtained on canvas or paper never seem to us objective. We are too familiar with the processes of which they are the effects. These processes remain a subjective discovery: they are ourselves, our inspiration, our ruse, and when we seek to perceive our work, we create it again, we repeat mentally the operations which produced it; each of its aspects appears as a result. Thus, in the perception, the object is given as the essential thing and the subject as the inessential. The latter seeks essential in the creation and obtains it, but then it is the object which becomes the inessential.

The dialectic is nowhere more apparent than in the art of writing, for the literary object is a peculiar top which exists only in movement. To make it come into view a concrete act called reading is necessary, and it lasts only as long as this act can last. Beyond that, there are only black marks on paper. Now, the writer cannot read what he writes, whereas the shoemaker can put on the shoes he has just made if they are of his size, and the architect can live in the house he has built. In reading, one foresees: one waits. He foresees the end of the sentence, the following sentence, the next page. He waits for them to confirm or disappoint his foresights. The reading is composed of a host of hypotheses, followed by awakenings, of hopes and deceptions. Readers are always ahead of the sentence they are reading in a merely probable future which partly collapses and partly comes together in proportion as they progress, which withdraws from one page to the next and forms the moving horizon of the literary object. Without waiting, without a future, without ignorance, there is no objectivity.

The art of writing manifests the dialectic of perception and creation because

A. reading reveals the writing till the act of reading lasts.
B. writing to be meaningful needs the concrete act of reading.
C. this art is anticipated and progresses on a series of hypotheses.
D. this literary object has a moving horizon brought about by the very act of creation.

## 5.2.284 English Language: CAT 1999 | Question: 40 top

**Read the passage and answer the question:**

Since Second World War, the nation state has been regarded with approval by every political system and every ideology. In the name of modernization in the West, of socialism in the Eastern Bloc, and of the development in the Third World, it was expected to guarantee the happiness of individuals as citizens and of people as societies. However, the state today appears to have broken down in many parts of the world. It has failed to guarantee either security or social justice, and has been unable to prevent either international wars or civil wars. Distributed by the claims of communities within it, the nation state tries to repress their demands and to proclaim itself as the only guarantor of security of all. In the name of national unity, territorial integrity, equality of all its citizens and non-partisan secularism, the state can use its powerful resources to reject the demands of the communities; it may even go so far as genocide to ensure that order prevails.

As one observes the awakening of communities in different parts of the world, one cannot ignore the context in which identity issues arise. It is no longer a context of sealed frontiers and isolated regions but is one of the integrated global systems. In a reaction to this trend towards globalization, individuals and communities everywhere are voicing their desire to exist, to use their power of creation and to play an active part in national and international life.

There are two ways in which the current upsurge in demands for the recognition of identities can be looked at. On the positive side, the efforts by certain population groups to assert their identity can be regarded as ‘liberation movements’, challenging oppression and injustice. What these groups are doing — proclaiming that they are different, rediscovering the roots of their culture or strengthening group solidarity — may accordingly be seen as legitimate attempts to escape from their state of subjugation and enjoy a certain measure of dignity. On the downside, however, militant action for recognition tends to make such groups more deeply entrenched in their attitude and to make their cultural compartments even more watertight. The assertion of identity then starts turning into self-absorption and isolation, and is liable to slide into intolerance of others and towards ideas of ‘ethnic cleansing’, xenophobia and violence.

Whereas continuous variations among people prevent drawing of clear dividing lines between the groups, those militating for recognition of their group’s identity arbitrarily choose a limited number of criteria such as religion, language, skin colour, and place of origin so that their members recognize themselves primarily in terms of the labels attached to the group whose existence is being asserted . This distinction between the group in question and other groups is established by simplifying the feature selected. Simplification also works by transforming groups into essences, abstractions endowed with the capacity to remain unchanged through time. In some cases, people actually act as though the group has remained unchanged and talk, for example, about the history of nations and communities as if these entities survived for centuries without changing, with the same ways of acting and thinking, the same desires, anxieties, and aspirations.

Paradoxically, precisely because identity represents a simplifying fiction, creating uniform groups out of disparate people, that identity performs a cognitive function. It enables us to put names to ourselves and others, form some idea of who we are and who others are, and ascertain the place we occupy along with the others in the world and society. The current upsurge to assert the identity of groups can thus be partly explained by the cognitive function performed by identity. However, that said, people would not go along as they do, often in large numbers, with the propositions put to them, in spite of the sacrifices they entail, if there was not a very strong feeling of need for identity, a need to take stock of things and know ‘who we are’, ‘where we come from’ and ‘where we are going’.

Identity is thus a necessity in a constantly changing world, but it can also be a potent source of violence and disruption. How

can these two contradictory aspects of identity be reconciled? First, we must bear the arbitrary nature of identity categories in mind, not with a view to eliminating all forms of identification — which would be unrealistic since identity is a cognitive necessity — but simply to remind ourselves that each of us has several identities at the same time. Second, since tears of nostalgia are being shed over the past, we recognize that culture is constantly being recreated by cobbling together fresh and original elements and counter-cultures. There are in our own country a large number of syncretic cults wherein modern elements are blended with traditional values or people of different communities venerate saints or divinities of particular faiths. Such cults and movements are characterized by a continual inflow and outflow of members which prevent them from taking on a self-perpetuating existence of their own and hold our hope for the future, indeed, perhaps for the only possible future. Finally, the nation state must respond to the identity urges of its constituent communities and to their legitimate quest for security and social justice. It must do so by inventing what the French philosopher and sociologist, Raymond Aron, called 'peace through law'. That would guarantee justice both to the state as a whole and its parts, and respect the claims of both reason and emotions. The problem is one of reconciling nationalist demands with exercise of democracy.

According to the author, happiness of individuals was expected to be guaranteed in the name of

A. development in the Third World.
B. socialism in the Third World.
C. development in the West.
D. modernization in the Eastern Bloc.

It has failed to guarantee either security or social justice, and has been unable to prevent either international wars or civil wars. Distributed by the claims of communities within it, the nation state tries to repress their demands and to proclaim itself as the only guarantor of security of all. In the name of national unity, territorial integrity, equality of all its citizens and non-partisan secularism, the state can use its powerful resources to reject the demands of the communities; it may even go so far as genocide to ensure that order prevails.

As one observes the awakening of communities in different parts of the world, one cannot ignore the context in which identity issues arise. It is no longer a context of sealed frontiers and isolated regions but is one of the integrated global systems. In a reaction to this trend towards globalization, individuals and communities everywhere are voicing their desire to exist, to use their power of creation and to play an active part in national and international life.

There are two ways in which the current upsurge in demands for the recognition of identities can be looked at. On the positive side, the efforts by certain population groups to assert their identity can be regarded as 'liberation movements', challenging oppression and injustice. What these groups are doing — proclaiming that they are different, rediscovering the roots of their culture or strengthening group solidarity — may accordingly be seen as legitimate attempts to escape from their state of subjugation and enjoy a certain measure of dignity. On the downside, however, militant action for recognition tends to make such groups more deeply entrenched in their attitude and to make their cultural compartments even more watertight. The assertion of identity then starts turning into self-absorption and isolation, and is liable to slide into intolerance of others and towards ideas of 'ethnic cleansing', xenophobia and violence.

Whereas continuous variations among people prevent drawing of clear dividing lines between the groups, those militating for recognition of their group's identity arbitrarily choose a limited number of criteria such as religion, language, skin colour, and place of origin so that their members recognize themselves primarily in terms of the labels attached to the group whose existence is being asserted . This distinction between the group in question and other groups is established by simplifying the feature selected. Simplification also works by transforming groups into essences, abstractions endowed with the capacity to remain unchanged through time. In some cases, people actually act as though the group has remained unchanged and talk, for example, about the history of nations and communities as if these entities survived for centuries without changing, with the same ways of acting and thinking, the same desires, anxieties, and aspirations.

Paradoxically, precisely because identity represents a simplifying fiction, creating uniform groups out of disparate people, that identity performs a cognitive function. It enables us to put names to ourselves and others, form some idea of who we are and who others are, and ascertain the place we occupy along with the others in the world and society. The current upsurge to assert the identity of groups can thus be partly explained by the cognitive function performed by identity. However, that said, people would not go along as they do, often in large numbers, with the propositions put to them, in spite of the sacrifices they entail, if there was not a very strong feeling of need for identity, a need to take stock of things and know 'who we are', 'where we come from' and 'where we are going'.

Identity is thus a necessity in a constantly changing world, but it can also be a potent source of violence and disruption. How can these two contradictory aspects of identity be reconciled? First, we must bear the arbitrary nature of identity categories in mind, not with a view to eliminating all forms of identification — which would be unrealistic since identity is a cognitive necessity — but simply to remind ourselves that each of us has several identities at the same time. Second, since tears of nostalgia are being shed over the past, we recognize that culture is constantly being recreated by cobbling together fresh and original elements and counter-cultures. There are in our own country a large number of syncretic cults wherein modern elements are blended with traditional values or people of different communities venerate saints or divinities of particular faiths. Such cults and movements are characterized by a continual inflow and outflow of members which prevent them from taking on

a self-perpetuating existence of their own and hold our hope for the future, indeed, perhaps for the only possible future. Finally, the nation state must respond to the identity urges of its constituent communities and to their legitimate quest for security and social justice. It must do so by inventing what the French philosopher and sociologist, Raymond Aron, called 'peace through law'. That would guarantee justice both to the state as a whole and its parts, and respect the claims of both reason and emotions. The problem is one of reconciling nationalist demands with exercise of democracy.

Going by the author's exposition of the nature of identity, which of the following statements is untrue?

A. Identity represents creating uniform groups out of disparate people.
B. Identity is a necessity in the changing world.
C. Identity is a cognitive necessity.
D. None of the above

## 5.2.287 English Language: CAT 1999 | Question: 43 top

**Read the passage and answer the question:**

Since Second World War, the nation state has been regarded with approval by every political system and every ideology. In the name of modernization in the West, of socialism in the Eastern Bloc, and of the development in the Third World, it was expected to guarantee the happiness of individuals as citizens and of people as societies. However, the state today appears to have broken down in many parts of the world. It has failed to guarantee either security or social justice, and has been unable to prevent either international wars or civil wars. Distributed by the claims of communities within it, the nation state tries to repress their demands and to proclaim itself as the only guarantor of security of all. In the name of national unity, territorial integrity, equality of all its citizens and non-partisan secularism, the state can use its powerful resources to reject the demands of the communities; it may even go so far as genocide to ensure that order prevails.

As one observes the awakening of communities in different parts of the world, one cannot ignore the context in which identity issues arise. It is no longer a context of sealed frontiers and isolated regions but is one of the integrated global systems. In a reaction to this trend towards globalization, individuals and communities everywhere are voicing their desire to exist, to use their power of creation and to play an active part in national and international life.

There are two ways in which the current upsurge in demands for the recognition of identities can be looked at. On the positive side, the efforts by certain population groups to assert their identity can be regarded as 'liberation movements', challenging oppression and injustice. What these groups are doing — proclaiming that they are different, rediscovering the roots of their culture or strengthening group solidarity — may accordingly be seen as legitimate attempts to escape from their state of subjugation and enjoy a certain measure of dignity. On the downside, however, militant action for recognition tends to make such groups more deeply entrenched in their attitude and to make their cultural compartments even more watertight. The assertion of identity then starts turning into self-absorption and isolation, and is liable to slide into intolerance of others and towards ideas of 'ethnic cleansing', xenophobia and violence.

Whereas continuous variations among people prevent drawing of clear dividing lines between the groups, those militating for recognition of their group's identity arbitrarily choose a limited number of criteria such as religion, language, skin colour, and place of origin so that their members recognize themselves primarily in terms of the labels attached to the group whose existence is being asserted . This distinction between the group in question and other groups is established by simplifying the feature selected. Simplification also works by transforming groups into essences, abstractions endowed with the capacity to remain unchanged through time. In some cases, people actually act as though the group has remained unchanged and talk, for example, about the history of nations and communities as if these entities survived for centuries without changing, with the same ways of acting and thinking, the same desires, anxieties, and aspirations.

Paradoxically, precisely because identity represents a simplifying fiction, creating uniform groups out of disparate people, that identity performs a cognitive function. It enables us to put names to ourselves and others, form some idea of who we are and who others are, and ascertain the place we occupy along with the others in the world and society. The current upsurge to assert the identity of groups can thus be partly explained by the cognitive function performed by identity. However, that said, people would not go along as they do, often in large numbers, with the propositions put to them, in spite of the sacrifices they entail, if there was not a very strong feeling of need for identity, a need to take stock of things and know 'who we are', 'where we come from' and 'where we are going'.

Identity is thus a necessity in a constantly changing world, but it can also be a potent source of violence and disruption. How can these two contradictory aspects of identity be reconciled? First, we must bear the arbitrary nature of identity categories in mind, not with a view to eliminating all forms of identification — which would be unrealistic since identity is a cognitive necessity — but simply to remind ourselves that each of us has several identities at the same time. Second, since tears of nostalgia are being shed over the past, we recognize that culture is constantly being recreated by cobbling together fresh and original elements and counter-cultures. There are in our own country a large number of syncretic cults wherein modern elements are blended with traditional values or people of different communities venerate saints or divinities of particular faiths. Such cults and movements are characterized by a continual inflow and outflow of members which prevent them from taking on a self-perpetuating existence of their own and hold our hope for the future, indeed, perhaps for the only possible future. Finally, the nation state must respond to the identity urges of its constituent communities and to their legitimate quest for security and

social justice. It must do so by inventing what the French philosopher and sociologist, Raymond Aron, called ‘peace through law’. That would guarantee justice both to the state as a whole and its parts, and respect the claims of both reason and emotions. The problem is one of reconciling nationalist demands with exercise of democracy.

According to the author, the nation state

A. has fulfilled its potential.
B. is willing to do anything to preserve order.
C. generates security for all its citizens.
D. has been a major force in preventing civil and international wars.

## 5.2.288 English Language: CAT 1999 | Question: 44 top

**Read the passage and answer the question:**

Since Second World War, the nation state has been regarded with approval by every political system and every ideology. In the name of modernization in the West, of socialism in the Eastern Bloc, and of the development in the Third World, it was expected to guarantee the happiness of individuals as citizens and of people as societies. However, the state today appears to have broken down in many parts of the world. It has failed to guarantee either security or social justice, and has been unable to prevent either international wars or civil wars. Distributed by the claims of communities within it, the nation state tries to repress their demands and to proclaim itself as the only guarantor of security of all. In the name of national unity, territorial integrity, equality of all its citizens and non-partisan secularism, the state can use its powerful resources to reject the demands of the communities; it may even go so far as genocide to ensure that order prevails.

As one observes the awakening of communities in different parts of the world, one cannot ignore the context in which identity issues arise. It is no longer a context of sealed frontiers and isolated regions but is one of the integrated global systems. In a reaction to this trend towards globalization, individuals and communities everywhere are voicing their desire to exist, to use their power of creation and to play an active part in national and international life.

There are two ways in which the current upsurge in demands for the recognition of identities can be looked at. On the positive side, the efforts by certain population groups to assert their identity can be regarded as ‘liberation movements’, challenging oppression and injustice. What these groups are doing — proclaiming that they are different, rediscovering the roots of their culture or strengthening group solidarity — may accordingly be seen as legitimate attempts to escape from their state of subjugation and enjoy a certain measure of dignity. On the downside, however, militant action for recognition tends to make such groups more deeply entrenched in their attitude and to make their cultural compartments even more watertight. The assertion of identity then starts turning into self-absorption and isolation, and is liable to slide into intolerance of others and towards ideas of ‘ethnic cleansing’, xenophobia and violence.

Whereas continuous variations among people prevent drawing of clear dividing lines between the groups, those militating for recognition of their group’s identity arbitrarily choose a limited number of criteria such as religion, language, skin colour, and place of origin so that their members recognize themselves primarily in terms of the labels attached to the group whose existence is being asserted . This distinction between the group in question and other groups is established by simplifying the feature selected. Simplification also works by transforming groups into essences, abstractions endowed with the capacity to remain unchanged through time. In some cases, people actually act as though the group has remained unchanged and talk, for example, about the history of nations and communities as if these entities survived for centuries without changing, with the same ways of acting and thinking, the same desires, anxieties, and aspirations.

Paradoxically, precisely because identity represents a simplifying fiction, creating uniform groups out of disparate people, that identity performs a cognitive function. It enables us to put names to ourselves and others, form some idea of who we are and who others are, and ascertain the place we occupy along with the others in the world and society. The current upsurge to assert the identity of groups can thus be partly explained by the cognitive function performed by identity. However, that said, people would not go along as they do, often in large numbers, with the propositions put to them, in spite of the sacrifices they entail, if there was not a very strong feeling of need for identity, a need to take stock of things and know ‘who we are’, ‘where we come from’ and ‘where we are going’.

Identity is thus a necessity in a constantly changing world, but it can also be a potent source of violence and disruption. How can these two contradictory aspects of identity be reconciled? First, we must bear the arbitrary nature of identity categories in mind, not with a view to eliminating all forms of identification — which would be unrealistic since identity is a cognitive necessity — but simply to remind ourselves that each of us has several identities at the same time. Second, since tears of nostalgia are being shed over the past, we recognize that culture is constantly being recreated by cobbling together fresh and original elements and counter-cultures. There are in our own country a large number of syncretic cults wherein modern elements are blended with traditional values or people of different communities venerate saints or divinities of particular faiths. Such cults and movements are characterized by a continual inflow and outflow of members which prevent them from taking on a self-perpetuating existence of their own and hold our hope for the future, indeed, perhaps for the only possible future. Finally, the nation state must respond to the identity urges of its constituent communities and to their legitimate quest for security and social justice. It must do so by inventing what the French philosopher and sociologist, Raymond Aron, called ‘peace through law’. That would guarantee justice both to the state as a whole and its parts, and respect the claims of both reason and

emotions. The problem is one of reconciling nationalist demands with exercise of democracy.

Which of the following views of the nation state cannot be attributed to the author?

A. It has not guaranteed peace and security.
B. It may go as far as genocide for self-preservation.
C. It represents the demands of communities within it.
D. It is unable to prevent international wars.

## 5.2.289 English Language: CAT 1999 | Question: 45 top

**Read the passage and answer the question:**

The persistent patterns in the way nations fight reflect their cultural and historical traditions and deeply-rooted attitudes that collectively make up their strategic culture. These patterns provide insights that go beyond what can be learnt just by comparing armaments and divisions. In the Vietnam War, the strategic tradition of the United States called for forcing the enemy to fight a massed battle in an open area, where superior American weapons would prevail. The United States was trying to re-fight Second World War in the jungles of South-east Asia, against an enemy with no intention of doing so.

Some British historians describe the Asian way of war as one of indirect attacks, avoiding frontal attacks meant to overpower an opponent. This traces back to Asian history and geography: the great distances and harsh terrain have often made it difficult to execute the sort of open field clashes allowed by the flat terrain and relatively compact size of Europe. A very different strategic tradition arose in Asia.

The bow and arrow were metaphors for an Eastern way of war. By its nature, the arrow is an indirect weapon. Fired from a distance of hundreds of yards, it does not necessitate immediate physical contact with the enemy. Thus, it can be fired from hidden positions. When fired from behind a ridge, the barrage seems to come out of nowhere, taking the enemy by surprise. The tradition of this kind of fighting is captured in the classical strategic writing of the East. The 2,000 years worth of Chinese writings on war constitutes the most subtle writing on the subject in any language. Not until Clausewitz, did the West produce a strategic theorist to match the sophistication of Sun-tzu, whose Art of War was written 2,300 years earlier.

In Sun-tzu and other Chinese writings, the highest achievement of arms is to defeat an adversary without fighting. He wrote: “To win one hundred victories in one hundred battles is not the acme of skill. To subdue the enemy without fighting is the supreme excellence.” Actual combat is just one among many means towards the goal of subduing an adversary. War contains too many surprises to be a first resort. It can lead to ruinous losses, as has been seen time and again. It can have the unwanted effect of inspiring heroic efforts in an enemy, as the United States learned in Vietnam, and as the Japanese found out after Pearl Harbour.

Aware of the uncertainties of a military campaign, Sun-tzu advocated war only after the most thorough preparations. Even then, it should be quick and clean. Ideally, the army is just an instrument to deal the final blow to an enemy already weakened by isolation, poor morale, and disunity. Ever since Sun-tzu, the Chinese have been seen as masters of subtlety who take measured actions to manipulate an adversary without his knowledge. The dividing line between war and peace can be obscure. Low level violence often is the backdrop to a larger strategic campaign. The unwitting victim, focused on the day-to-day events, never realizes what’s happening to him until it’s too late. History holds many examples. The Viet Cong lured French and US infantry deep into the jungle, weakening their morale over several years. The mobile army of the United States was designed to fight on the plains of Europe, where it could quickly move unhindered from one spot to the next. The jungle did more than make quick movement impossible; broken down into smaller units and scattered in isolated bases, US forces were deprived of the feeling of support and protection that ordinarily comes from being part of a big army.

The isolation of US troops in Vietnam was not just a logistical detail, something that could be overcome by, for instance, bringing in reinforcements by helicopter. In a big army reinforcements are readily available. It was Napoleon who realized the extraordinary effects on morale that come from being part of a larger formation. Just the knowledge of it lowers the soldier’s fear and increases his aggressiveness. In the jungle and on isolated bases, this feeling was removed. The thick vegetation slowed down the reinforcements and made it difficult to find stranded units. Soldiers felt they were on their own.

More important, by altering the way the war was fought, the Viet Cong stripped the United States of its belief in the inevitability of victory, as it had done to the French before them. Morale was high when these armies first went to Vietnam. Only after many years of debilitating and demoralizing fighting did Hanoi launch its decisive attacks, at Dien Bien Phu in 1954 and against Saigon in 1975. It should be recalled that in the final push to victory the North Vietnamese abandoned their jungle guerrilla tactics completely, committing their entire army of twenty divisions to pushing the South Vietnamese into collapse. This final battle, with the enemy’s army all in one place, was the one that the United States had desperately wanted to fight in 1965. When it did come out into the open in 1975, Washington had already withdrawn its forces and there was no possibility of re-intervention.

The Japanese early in Second World War used a modern form of the indirect attack, one that relied on stealth and surprise for its effects. At Pearl Harbour, in the Philippines, and in South-east Asia, stealth and surprise were attained by sailing under radio silence so that the navy’s movements could not be tracked, Moving troops aboard ships into South-east Asia made it appear that the Japanese army was also ’invisible’. Attacks against Hawaii and Singapore seemed, to the American and British defenders, to come from nowhere. In Indonesia and the Philippines the Japanese attack was even faster than the German blitz against France in the West.

The greatest military surprises in American history have all been in Asia. Surely, there is something going on here beyond the

purely technical difficulties of detecting enemy movements. Pearl Harbour, the Chinese intervention in Korea, and the Tet offensive in Vietnam all came out of a tradition of surprise and stealth. US technical intelligence — the location of enemy units and their movements — was greatly improved after each surprise, but with no noticeable improvement in the American ability to foresee or prepare what would happen next. There is a cultural divide here, not just a technical one. Even when it was possible to track an army with intelligence satellites, as when Iraq invaded Kuwait or when Syria and Egypt attacked Israel, surprise was achieved. The United States was stunned by Iraq's attack on Kuwait even though it had satellite pictures of Iraqi troops massing at the border.

The exception that proves the point that cultural differences obscure the West's understanding of Asian behaviour was the Soviet Union's 1979 invasion of Afghanistan. This was fully anticipated and understood in advance. There was no surprise because the United States understood Moscow's world view and thinking. It could anticipate Soviet action almost as well as the Soviets themselves, because the Soviet Union was really a western country.

The difference between the eastern and the western way of war is striking. The West's great strategic writer, Clausewitz, linked war to politics, as did Sun-tzu. Both were opponents of militarism, of turning war over to the generals. But there, all similarity ends. Clausewitz wrote that the way to achieve a larger political purpose is through destruction of the enemy's army. After observing Napoleon conquer Europe by smashing enemy armies to bits, Clausewitz made his famous remark in On War (1932) that combat is the continuation of politics by violent means. Morale and unity are important, but they should be harnessed for the ultimate battle. If the eastern way of war is embodied by the stealthy archer, the metaphorical western counterpart is the swordsman charging forward, seeking a decisive showdown, eager to administer the blow that will obliterate the enemy once and for all. In this view, war proceeds along a fixed course and occupies a finite extent of time, like a play in three acts with a beginning, a middle, and an end. The end, the final scene, decides the issue for good.

When things don't work out quite this way, the western military mind feels tremendous frustration. Sun-tzu's great disciples, Mao Zedong and Ho Chi Minh, are respected in Asia for their clever use of indirection and deception to achieve an advantage over stronger adversaries. But in the West their approach is seen as underhanded and devious. To the American strategic mind, the Viet Cong guerilla did not fight fairly. They should have come out into the open and fought like men, instead of hiding in the jungle and sneaking around like a cat in the night.

According to the author, the main reason for the US losing the Vietnam War was

A. the Vietnamese understood the local terrain better.
B. the lack of support for the war from the American people.
C. the failure of the US to mobilize its military strength.
D. their inability to fight a war on terms other than those they understood well.

The unwitting victim, focused on the day-to-day events, never realizes what’s happening to him until it’s too late. History holds many examples. The Viet Cong lured French and US infantry deep into the jungle, weakening their morale over several years. The mobile army of the United States was designed to fight on the plains of Europe, where it could quickly move unhindered from one spot to the next. The jungle did more than make quick movement impossible; broken down into smaller units and scattered in isolated bases, US forces were deprived of the feeling of support and protection that ordinarily comes from being part of a big army.

The isolation of US troops in Vietnam was not just a logistical detail, something that could be overcome by, for instance, bringing in reinforcements by helicopter. In a big army reinforcements are readily available. It was Napoleon who realized the extraordinary effects on morale that come from being part of a larger formation. Just the knowledge of it lowers the soldier’s fear and increases his aggressiveness. In the jungle and on isolated bases, this feeling was removed. The thick vegetation slowed down the reinforcements and made it difficult to find stranded units. Soldiers felt they were on their own.

More important, by altering the way the war was fought, the Viet Cong stripped the United States of its belief in the inevitability of victory, as it had done to the French before them. Morale was high when these armies first went to Vietnam. Only after many years of debilitating and demoralizing fighting did Hanoi launch its decisive attacks, at Dien Bien Phu in 1954 and against Saigon in 1975. It should be recalled that in the final push to victory the North Vietnamese abandoned their jungle guerrilla tactics completely, committing their entire army of twenty divisions to pushing the South Vietnamese into collapse. This final battle, with the enemy’s army all in one place, was the one that the United States had desperately wanted to fight in 1965. When it did come out into the open in 1975, Washington had already withdrawn its forces and there was no possibility of re-intervention.

The Japanese early in Second World War used a modern form of the indirect attack, one that relied on stealth and surprise for its effects. At Pearl Harbour, in the Philippines, and in South-east Asia, stealth and surprise were attained by sailing under radio silence so that the navy’s movements could not be tracked, Moving troops aboard ships into South-east Asia made it appear that the Japanese army was also ’invisible’. Attacks against Hawaii and Singapore seemed, to the American and British defenders, to come from nowhere. In Indonesia and the Philippines the Japanese attack was even faster than the German blitz against France in the West.

The greatest military surprises in American history have all been in Asia. Surely, there is something going on here beyond the purely technical difficulties of detecting enemy movements. Pearl Harbour, the Chinese intervention in Korea, and the Tet offensive in Vietnam all came out of a tradition of surprise and stealth. US technical intelligence — the location of enemy units and their movements — was greatly improved after each surprise, but with no noticeable improvement in the American ability to foresee or prepare what would happen next. There is a cultural divide here, not just a technical one. Even when it was possible to track an army with intelligence satellites, as when Iraq invaded Kuwait or when Syria and Egypt attacked Israel, surprise was achieved. The United States was stunned by Iraq’s attack on Kuwait even though it had satellite pictures of Iraqi troops massing at the border.

The exception that proves the point that cultural differences obscure the West's understanding of Asian behaviour was the Soviet Union's 1979 invasion of Afghanistan. This was fully anticipated and understood in advance. There was no surprise because the United States understood Moscow's world view and thinking. It could anticipate Soviet action almost as well as the Soviets themselves, because the Soviet Union was really a western country.

The difference between the eastern and the western way of war is striking. The West's great strategic writer, Clausewitz, linked war to politics, as did Sun-tzu. Both were opponents of militarism, of turning war over to the generals. But there, all similarity ends. Clausewitz wrote that the way to achieve a larger political purpose is through destruction of the enemy's army. After observing Napoleon conquer Europe by smashing enemy armies to bits, Clausewitz made his famous remark in On War (1932) that combat is the continuation of politics by violent means. Morale and unity are important, but they should be harnessed for the ultimate battle. If the eastern way of war is embodied by the stealthy archer, the metaphorical western counterpart is the swordsman charging forward, seeking a decisive showdown, eager to administer the blow that will obliterate the enemy once and for all. In this view, war proceeds along a fixed course and occupies a finite extent of time, like a play in three acts with a beginning, a middle, and an end. The end, the final scene, decides the issue for good.

When things don't work out quite this way, the western military mind feels tremendous frustration. Sun-tzu's great disciples, Mao Zedong and Ho Chi Minh, are respected in Asia for their clever use of indirection and deception to achieve an advantage over stronger adversaries. But in the West their approach is seen as underhanded and devious. To the American strategic mind, the Viet Cong guerilla did not fight fairly. They should have come out into the open and fought like men, instead of hiding in the jungle and sneaking around like a cat in the night.

A. Actual combat is the principal means of subduing an adversary.
B. War should be undertaken only after thorough preparation.
C. War is linked to politics.
D. War should not be left to the generals alone.

## 5.2.292 English Language: CAT 1999 | Question: 48 top

**Read the passage and answer the question:**

**Read the passage and answer the question:**

The persistent patterns in the way nations fight reflect their cultural and historical traditions and deeply-rooted attitudes that collectively make up their strategic culture. These patterns provide insights that go beyond what can be learnt just by comparing armaments and divisions. In the Vietnam War, the strategic tradition of the United States called for forcing the enemy to fight a massed battle in an open area, where superior American weapons would prevail. The United States was trying to re-fight Second World War in the jungles of South-east Asia, against an enemy with no intention of doing so.

Some British historians describe the Asian way of war as one of indirect attacks, avoiding frontal attacks meant to overpower an opponent. This traces back to Asian history and geography: the great distances and harsh terrain have often made it difficult to execute the sort of open field clashes allowed by the flat terrain and relatively compact size of Europe. A very different strategic tradition arose in Asia.

The bow and arrow were metaphors for an Eastern way of war. By its nature, the arrow is an indirect weapon. Fired from a distance of hundreds of yards, it does not necessitate immediate physical contact with the enemy. Thus, it can be fired from hidden positions. When fired from behind a ridge, the barrage seems to come out of nowhere, taking the enemy by surprise. The tradition of this kind of fighting is captured in the classical strategic writing of the East. The 2,000 years worth of Chinese writings on war constitutes the most subtle writing on the subject in any language. Not until Clausewitz, did the West produce a strategic theorist to match the sophistication of Sun-tzu, whose Art of War was written 2,300 years earlier.

In Sun-tzu and other Chinese writings, the highest achievement of arms is to defeat an adversary without fighting. He wrote: "To win one hundred victories in one hundred battles is not the acme of skill. To subdue the enemy without fighting is the supreme excellence." Actual combat is just one among many means towards the goal of subduing an adversary. War contains too many surprises to be a first resort. It can lead to ruinous losses, as has been seen time and again. It can have the unwanted effect of inspiring heroic efforts in an enemy, as the United States learned in Vietnam, and as the Japanese found out after Pearl Harbour.

Aware of the uncertainties of a military campaign, Sun-tzu advocated war only after the most thorough preparations. Even then, it should be quick and clean. Ideally, the army is just an instrument to deal the final blow to an enemy already weakened by isolation, poor morale, and disunity. Ever since Sun-tzu, the Chinese have been seen as masters of subtlety who take measured actions to manipulate an adversary without his knowledge. The dividing line between war and peace can be obscure. Low level violence often is the backdrop to a larger strategic campaign. The unwitting victim, focused on the day-to-day events, never realizes what's happening to him until it's too late. History holds many examples. The Viet Cong lured French and US infantry deep into the jungle, weakening their morale over several years. The mobile army of the United States was designed to fight on the plains of Europe, where it could quickly move unhindered from one spot to the next. The jungle did more than make quick movement impossible; broken down into smaller units and scattered in isolated bases, US forces were deprived of the feeling of support and protection that ordinarily comes from being part of a big army.

The isolation of US troops in Vietnam was not just a logistical detail, something that could be overcome by, for instance, bringing in reinforcements by helicopter. In a big army reinforcements are readily available. It was Napoleon who realized the extraordinary effects on morale that come from being part of a larger formation. Just the knowledge of it lowers the soldier's

fear and increases his aggressiveness. In the jungle and on isolated bases, this feeling was removed. The thick vegetation slowed down the reinforcements and made it difficult to find stranded units. Soldiers felt they were on their own.

More important, by altering the way the war was fought, the Viet Cong stripped the United States of its belief in the inevitability of victory, as it had done to the French before them. They should have come out into the open and fought like men, instead of hiding in the jungle and sneaking around like a cat in the night.

To the Americans, the approach of the Viet Cong seemed devious because

A. the Viet Cong did not fight like men out in the open.
B. the Viet Cong allied with America's enemies.
C. the Viet Cong took strategic advice from Mao Zedong.
D. the Viet Cong used bows and arrows rather than conventional weapons.

They should have come out into the open and fought like men, instead of hiding in the jungle and sneaking around like a cat in the night.

According to the author, the greatest military surprises in American history have been in Asia because

A. the Americans failed to implement their military strategies many miles away from their own country.
B. the Americans were unable to use their technologies like intelligence satellites effectively to detect enemy movements.
C. the Americans failed to understand the Asian culture of war that was based on stealth and surprise.
D. Clausewitz is inferior to Sun-tzu.

A Huge majority – 84 percent – of the population identifies as Hindu. There are many variations of Hinduism, and four predominant sects – Shiva, Vaishnava, Shakteya and Smarta. About 13 percent of Indians are Muslim, making it one of the largest Islamic nations in the world. Christians and Sikhs make up a small percentage of the population, and there are even fewer Buddhists and Jains.

The passage best supports the statement that

A. Culture, Traditions and Customs of India are diverse.
B. India is known as a multilingual country.
C. India is identified as the birthplace of Hinduism and Buddhism.
D. India is a country where diversity in religion exists.

**Read the passage carefully and choose the best answer to each out of the four alternatives.**

Some years ago I had the privilege of meeting the world's oldest man. At least he said he was. And he was so dogmatic about it that the promoters of a cartoon strip that specialised in unbelievable oddities brought the old man up to New York from his

native Columbia, to have him examined by a team of doctors at the Cornell Medical Centre. He was an Indian, he was four feet four inches high, he had an alligator-hide complexion and a tendency to swing with his right whenever he was passed from one medico to another. He said he was 167, born the same year as the American Constitution. When the name of George Washington was suggested to him, to help him fix his generation, he said he remembered the man well. But he resented coming all the way to New York. He wanted to be left alone to go about his business, which at that time was the business of looking for a sixth wife to comfort him in his approaching old age.

The old man was 'dogmatic' about the fact that:

A. He was four feet four inches tall
B. He was the world's oldest living man
C. He belonged to Columbia
D. He had an alligator-hide complexion

Read the following passage carefully, and answer the questions given below them, in the context of the passage.

Strange, un-fathomable happiness of thinking of seeking knowledge for its own sake. So much of our life is spent in solving problems to avoid immediate pain or to bring immediate profit, so much of our training is aimed at bringing practical or pragmatic effect designing and running machines, buying, selling, cooking, furnishing. investing, spending, so many worthy results are obtained by purposeful planning and directed thinking that we forget how true and inexhaustible is the happiness of pure knowing. Everyone has tasted it. It is born in children. It goes to school with them, and is too often killed there by tired or practical teachers. But in some, it survives and unlike other delights it endures for life. To spend 50 or 60 years in studying the structure of fishes or the relation between logic and language, the history of the Incas or the rules of comets, the geometry of Non-Euclidean space, the literature of leei and/or the anatomy of the brain, to acquire, systematic and record new knowledge or any subject without expectation of benefit making except by extending its range of understanding that is to pass a happy and valuable life, usually tempered at the close by regret that another 50 years could not be added, in which to learn more and still more. It is the purest and least selfish satisfaction known to man, except those of creating a work of art and healing the sick. It is, Aristotle said, to share the activity of God-himself, his eternal life of pure contemplation

To spend 50 or 60 years… in which to learn more and still more. The illustration in this paragraph are examples of subjects that :

A. Have no direct relevance to the welfare of man
B. May be situated for their practical relevance or for the sake of knowledge
C. Have direct relevance to the welfare of man
D. Can be studied only for the sake of knowledge

## 5.6 Logic Puzzles (2) top

### 5.6.1 Logic Puzzles: CAT 2017 Set-1 | Question: 59 top

A new airlines company is planning to start operations in a country. The company has identified ten different cities which they plan to connect through their network to start with. The flight duration between any pair of cities will be less than one hour. To start operations, the company has to decide on a daily schedule.

The underlying principle that they are working on is the following:

Any person staying in any of these 10 cities should be able to make a trip to any other city in the morning and should be able to return by the evening of the same day.

If the underlying principle s to be satisfied in such a way that the journey between any two cities can be performed using only direct (non-stop) flights, then the minimum number of direct flights to be scheduled is

A. 45 B. 90 C. 180 D. 135

cat2017-1 logical-reasoning logic-puzzles

### 5.6.2 Logic Puzzles: CAT 2017 Set-1 | Question: 60 top

A new airlines company is planning to start operations in a country. The company has identified ten different cities which they plan to connect through their network to start with. The flight duration between any pair of cities will be less than one hour. To start operations, the company has to decide on a daily schedule.

The underlying principle that they are working on is the following:

Any person staying in any of these 10 cities should be able to make a trip to any other city in the morning and should be able to return by the evening of the same day.

Suppose three of the ten cities are to be developed as hubs. A hub is a city which is connected with every other city by direct flights each way, both in the morning as well as in the evening. The only direct flights which will be scheduled are originating and/or terminating in one of the hubs. Then the minimum number of direct flights that need to be scheduled so that the underlying principle of the airline to serve all the ten cities is met without visiting more than one hub during one trip is:

A. 54 B. 120 C. 96 D. 60

For each of the words below, a contextual usage is provided. Pick the word from the alternatives given that is most inappropriate in the given context.
FACETIOUS: When I suggested that war is a method of controlling population, my father remarked that I was being facetious.

A. Jovian B. Jovial C. Jocular D. Joking

cat2001 verbal-ability most-appropriate-alternative

Answer key

### 5.9.13 Most Appropriate Alternative: CAT 2003 | Question: 2-22 top

**Four alternative summaries are given below each text. Choose the option that best captures the essence of the text.**
Some decisions will be fairly obvious - “no-brainers.” Your bank account is low, but you have a twoweek vacation coming up and you want to get away to some place warm to relax with your family. Will you accept your in-laws‟ offer of free use of their Florida beachfront condo? Sure. You like your employer and feel ready to move forward in your career. Will you step in for your boss for three weeks while she attends a professional development course? Of course.

1. Some decisions are obvious under certain circumstances. You may, for example, readily accept a relative‟s offer of free holiday accommodation. Or step in for your boss when she is away.
2. Some decisions are no-brainers. You need not think when making them. Examples are condo offers from in-laws and job offers from bosses when your bank account is low or boss is away.
3. Easy decisions are called “no-brainers” because they do not require any cerebral activity. Examples such as accepting free holiday accommodation abound in our lives.
4. Accepting an offer from in-laws when you are short on funds and want a holiday is a no-brainer. Another no-brainer is taking the boss‟s job when she is away

A. 1 B. 2 C. 3 D. 4

cat2003-2 verbal-ability most-appropriate-alternative

### 5.9.14 Most Appropriate Alternative: CAT 2003 | Question: 2-23 top

**Four alternative summaries are given below each text. Choose the option that best captures the essence of the text.**

Physically, inertia is a feeling that you just can't move; mentally, it is a sluggish mind. Even if you try to be sensitive, if your mind is sluggish, you just don't feel anything intensely. You may even see a tragedy enacted in front of your eyes and not be able to respond meaningfully. You may see one person exploiting another, one group persecuting another, and not be able to get angry. Your energy is frozen. You are not deliberately refusing to act; you just don't have the capacity.

1. Inertia makes your body and mind sluggish. They become insensitive to tragedies, exploitation, and persecution because it freezes your energy and de-capacitates it.
2. When you have inertia you don't act although you see one person exploiting another or one group persecuting another. You don't get angry because you are incapable.
3. Inertia is of two types– physical and mental. Physical inertia restricts bodily movements. Mental inertia prevents mental response to events enacted in front of your eyes.
4. Physical inertia stops your body from moving; mental inertia freezes your energy, and stops your mind from responding meaningfully to events, even tragedies, in front of you.

A. 1 B. 2 C. 3 D. 4

cat2003-2 verbal-ability most-appropriate-alternative

### 5.9.15 Most Appropriate Alternative: CAT 2003 | Question: 2-24 top

**Four alternative summaries are given below each text. Choose the option that best captures the essence of the text.**
Try before you buy. We use this memorable saying to urge you to experience the consequences of an alternative before you

choose it, whenever this is feasible. If you are considering buying a van after having always owned sedans, rent one for a week or borrow a friend‟s. By experiencing the consequences first hand, they become more meaningful. In addition, you are likely to identify consequences you had not even thought of before. May be you will discover that it is difficult to park the van in your small parking space at work, but that, on the other hand, your elderly father has a much easier time getting in and out of it.

1. If you are planning to buy a van after being used to sedans, borrow a van or rent it and try it before deciding to buy it. Then you may realize that parking a van is difficult while it is easier for your elderly father to get in and out of it.
2. Before choosing an alternative, experience its consequences if feasible. If, for example, you want to change from sedans to a van, try one before buying it. You will discover aspects you may never have thought of.
3. Always try before you buy anything. You are bound to discover many consequences. One of the consequences of going in for a van is that it is more difficult to park than sedans at the office car park.
4. We urge you to try products such as vans before buying them. Then you can experience consequences you have not thought of such as parking problems. But your father may find vans more comfortable than cars.

A. 1 B. 2 C. 3 D. 4

cat2003-2 verbal-ability most-appropriate-alternative

### 5.9.16 Most Appropriate Alternative: CAT 2003 | Question: 2-25 top

**Four alternative summaries are given below each text. Choose the option that best captures the essence of the text.**
It is important for shipping companies to be clear about the objectives for maintenance and materials management– as to whether the primary focus is on service level improvement or cost minimization. Often when certain systems are set in place, the cost minimization objective and associated procedure become more important than the flexibility required for service level improvement. The problem really arises since cost minimization tends to focus on out of pocket costs which are visible, while the opportunity costs, often greater in value, are lost sight of.

1. Shipping companies have to either minimize costs or maximize service quality. If they focus on cost minimization, they will reduce quality. They should focus on service level improvement, or else opportunity costs will be lost sight of.
2. Shipping companies should determine the primary focus of their maintenance and materials management. Focus on cost minimization may reduce visible costs, but ignore greater invisible costs and impair service quality.
3. Any cost minimization program in shipping is bound to lower the quality of service. Therefore, shipping companies must be clear about the primary focus of their maintenance and materials management before embarking on cost minimization.
4. Shipping companies should focus on quality level improvement rather than cost cutting. Cost cutting will lead to untold opportunity costs. Companies should have systems in place to make the service level flexible.

A. 1 B. 2 C. 3 D. 4

## 5.11 Multiple Sub Parts (50) top

### 5.11.1 Multiple Sub Parts: CAT 1995 | Question: 101 top

Read the passages and answer the questions that follow:

Darwinian enthusiasts are too quick to read historical purposes into every biological trait. In Stephen Jay Gould's telling phrase, they are overly fond of 'just-so stories", which differ from Kipling's fables only in their lack of good jokes. Mr. Gould's immediate target here is "selfish-gene" theorists like Richard Dawkins, and it is a moot point whether he actually hits that mark. But, whatever you think of Mr. Dawkins, evolutionary psychology is indeed open to the just-so charge. In principle it may seem a good idea for psychology and evolutionary theory to pool their intellectual resources. But given the paucity of hard evidence on each side, the merger often seems to achieve little more than an incitement to fabulation.

The trouble is not just that human brains leave no fossils, though this is certainly one problem. Just as hazardous is the lack of definite knowledge about current mental mechanisms. This makes it all too tempting to put evolutionary speculation in the place of hard psychological evidence, and so conjure mental modules out of historical myth. Take Ms Cosmides's theory about

the evolution of a cheater-detection module. This is now widely accepted. But thereis no independent evidence, apart from Ms Cosmides's psychological experiments, for this historical story. Moreover, other psychologists now claim to have performed new experiments which show that a cheating factor is not the crucial variable in the Wason selection task after all. Less indulgent critics will say that the flirtation with evolution has simply led Ms Cosmides up a theoretical blind alley.

A similar charge can be leveled at other prize exhibits in the gallery of evolutionary psychology. The theories of human altruism described in Mr. Ridley's "The Origins of Virtue" involve any number of plausible ideas about the social practices of our hominid forefathers. But there is no real historical basis for these parables, and precious little direct evidence that today's humans display any corresponding dispositions. The ideas in Mr. Ridley's book exhibit game-theoretical sophistication and much ingenuity, and are worth reading for that reason alone, but they scarcely qualify as reliable science.

Then there is sex. Reproduction is centra1 to evolution, but there is room to wonder whether that explains the attention it gets from the more poporiented evolutionary psychologists. The leading light in this area is David Buss, or "The Doctor of Love", as he is fondly termed on "The Evolutionist" web page. His book, "The Evolution of Desire" reports the results of a questionnaire given to 10, 000 people in 37 countries. In every country, women like rich men, and men like young attractive women. Mr. Buss also explains that potential pick-ups start looking better as closing-time nears and worse again after sex. Well, maybe that is all so, and perhaps it has something to do with the evolutionary roles of the sexes. But Mr. Buss tells you little about the precise mechanism behind the behaviour. Defenders of evolutionary psychology may reasonably reply that there are better practitioners than Mr. Buss and more impressive examples of Darwinian accounts of human mental phenomena than singles-bar behaviour. Yet even the best samples of the evolutionary approach raise the question of its explanatory goal. Do the different examples, plucked here and there from the vast field of human mental life and behaviour, show promise of ever adding up to a coherent theory of the mind?

That question brings in the second main worry about evolutionary psychology: by emphasizing the modules it leaves out the important part of the mind. Evolutionary psychologists often liken the mind to a Swiss Army knife. It contains a large number of purpose-built tools, each designed for a quite specific purpose. But this picture prompts an obvious question. Who, or what, is deciding when to open which blades? Don't you need some central intelligence to orchestrate the overall operation? Some evolutionary psychologists say no. But, while that may be true of other animals, it makes little sense for humans. For one thing, you seem to need a central intelligence to understand human moral reasoning. Even if your modules incline you towards sexual and racial discrimination, for example, it does not follow that such discrimination is either inevitable or justified. If humans are just a collection of modular reflexes, how is it that they can correct their inclinations? Humans seem to need some mental faculty that can stand back from modular promptings and tell them how to do better.

There are less elevated examples of people monitoring the outputs of their purpose-specific mental modules. You are often quite aware that your visual system is fooling you: for example, when you look at trick drawings, or indeed when you watch television. If it is possible to question modular inclinations in this way, there must be some place in the mind which transcends the modules.

To insist that there is more to the mind than modules is not to deny humans' animal heritage: no doubt a person's central intelligence is itself an evolutionary product of the past. But it does mean that evolutionary psychology, like its predecessors, is in danger of ignoring the very thing that makes humans different from other animals. Perhaps evolutionary psychologists will soon shift their focus away from peripheral modules, and start contributing to an understanding of the really hard biological problem of the structure and function of the central intellectual abilities. Until then, they are unlikely to shed more than a sidelight on the human mind or to show people much about why they live the way they do.

What is Stephen Jay Gould's main objection to Darwinian theorists?

A. that they lack good jokes
B. that they are full of "just-so" stories
C. that they read meaning into every biological trait
D. that they do not see the practical aspects.

cat1995 english-language passage-reading multiple-sub-parts

## 5.11.2 Multiple Sub Parts: CAT 1995 | Question: 102 top

Read the passages and answer the questions that follow:

Darwinian enthusiasts are too quick to read historical purposes into every biological trait. In Stephen Jay Gould's telling phrase, they are overly fond of 'just-so stories", which differ from Kipling's fables only in their lack of good jokes. Mr. Gould's immediate target here is "selfish-gene" theorists like Richard Dawkins, and it is a moot point whether he actually hits that mark. But, whatever you think of Mr. Dawkins, evolutionary psychology is indeed open to the just-so charge. In principle it may seem a good idea for psychology and evolutionary theory to pool their intellectual resources. But given the paucity of hard evidence on each side, the merger often seems to achieve little more than an incitement to fabulation.

The trouble is not just that human brains leave no fossils, though this is certainly one problem. Just as hazardous is the lack of definite knowledge about current mental mechanisms. This makes it all too tempting to put evolutionary speculation in the place of hard psychological evidence, and so conjure mental modules out of historical myth. Take Ms Cosmides's theory about the evolution of a cheater-detection module. This is now widely accepted. But thereis no independent evidence, apart from Ms

Cosmides's psychological experiments, for this historical story. Moreover, other psychologists now claim to have performed new experiments which show that a cheating factor is not the crucial variable in the Wason selection task after all. Less indulgent critics will say that the flirtation with evolution has simply led Ms Cosmides up a theoretical blind alley.

A similar charge can be leveled at other prize exhibits in the gallery of evolutionary psychology. The theories of human altruism described in Mr. Ridley's "The Origins of Virtue" involve any number of plausible ideas about the social practices of our hominid forefathers. But there is no real historical basis for these parables, and precious little direct evidence that today's humans display any corresponding dispositions. The ideas in Mr. Ridley's book exhibit game-theoretical sophistication and much ingenuity, and are worth reading for that reason alone, but they scarcely qualify as reliable science.

Then there is sex. Reproduction is centra1 to evolution, but there is room to wonder whether that explains the attention it gets from the more poporiented evolutionary psychologists. The leading light in this area is David Buss, or "The Doctor of Love", as he is fondly termed on "The Evolutionist" web page. His book, "The Evolution of Desire" reports the results of a questionnaire given to 10, 000 people in 37 countries. In every country, women like rich men, and men like young attractive women. Mr. Buss also explains that potential pick-ups start looking better as closing-time nears and worse again after sex. Well, maybe that is all so, and perhaps it has something to do with the evolutionary roles of the sexes. But Mr. Buss tells you little about the precise mechanism behind the behaviour. Defenders of evolutionary psychology may reasonably reply that there are better practitioners than Mr. Buss and more impressive examples of Darwinian accounts of human mental phenomena than singles-bar behaviour. Yet even the best samples of the evolutionary approach raise the question of its explanatory goal. Do the different examples, plucked here and there from the vast field of human mental life and behaviour, show promise of ever adding up to a coherent theory of the mind?

That question brings in the second main worry about evolutionary psychology: by emphasizing the modules it leaves out the important part of the mind. Evolutionary psychologists often liken the mind to a Swiss Army knife. It contains a large number of purpose-built tools, each designed for a quite specific purpose. But this picture prompts an obvious question. Who, or what, is deciding when to open which blades? Don't you need some central intelligence to orchestrate the overall operation? Some evolutionary psychologists say no. But, while that may be true of other animals, it makes little sense for humans. For one thing, you seem to need a central intelligence to understand human moral reasoning. Even if your modules incline you towards sexual and racial discrimination, for example, it does not follow that such discrimination is either inevitable or justified. If humans are just a collection of modular reflexes, how is it that they can correct their inclinations? Humans seem to need some mental faculty that can stand back from modular promptings and tell them how to do better.

There are less elevated examples of people monitoring the outputs of their purpose-specific mental modules. You are often quite aware that your visual system is fooling you: for example, when you look at trick drawings, or indeed when you watch television. If it is possible to question modular inclinations in this way, there must be some place in the mind which transcends the modules.

To insist that there is more to the mind than modules is not to deny humans' animal heritage: no doubt a person's central intelligence is itself an evolutionary product of the past. But it does mean that evolutionary psychology, like its predecessors, is in danger of ignoring the very thing that makes humans different from other animals. Perhaps evolutionary psychologists will soon shift their focus away from peripheral modules, and start contributing to an understanding of the really hard biological problem of the structure and function of the central intellectual abilities. Until then, they are unlikely to shed more than a sidelight on the human mind or to show people much about why they live the way they do.

It can be inferred from the first paragraph that the author of the passage

A. agrees with Mr. Gould
B. disagrees with Mr. Gould
C. is neutral about Mr. Gould's argument
D. considers the objections objectively

cat1995 english-language passage-reading multiple-sub-parts

### 5.11.3 Multiple Sub Parts: CAT 1995 | Question: 103 top

Read the passages and answer the questions that follow:

Darwinian enthusiasts are too quick to read historical purposes into every biological trait. In Stephen Jay Gould's telling phrase, they are overly fond of 'just-so stories", which differ from Kipling's fables only in their lack of good jokes. Mr. Gould's immediate target here is "selfish-gene" theorists like Richard Dawkins, and it is a moot point whether he actually hits that mark. But, whatever you think of Mr. Dawkins, evolutionary psychology is indeed open to the just-so charge. In principle it may seem a good idea for psychology and evolutionary theory to pool their intellectual resources. But given the paucity of hard evidence on each side, the merger often seems to achieve little more than an incitement to fabulation.

The trouble is not just that human brains leave no fossils, though this is certainly one problem. Just as hazardous is the lack of definite knowledge about current mental mechanisms. This makes it all too tempting to put evolutionary speculation in the place of hard psychological evidence, and so conjure mental modules out of historical myth. Take Ms Cosmides's theory about the evolution of a cheater-detection module. This is now widely accepted. But thereis no independent evidence, apart from Ms Cosmides's psychological experiments, for this historical story. Moreover, other psychologists now claim to have performed new experiments which show that a cheating factor is not the crucial variable in the Wason selection task after all. Less indulgent critics will say that the flirtation with evolution has simply led Ms Cosmides up a theoretical blind alley.

A similar charge can be leveled at other prize exhibits in the gallery of evolutionary psychology. The theories of human altruism described in Mr. Ridley's "The Origins of Virtue" involve any number of plausible ideas about the social practices of our hominid forefathers. But there is no real historical basis for these parables, and precious little direct evidence that today's humans display any corresponding dispositions. The ideas in Mr. Ridley's book exhibit game-theoretical sophistication and much ingenuity, and are worth reading for that reason alone, but they scarcely qualify as reliable science.

Then there is sex. Reproduction is centra1 to evolution, but there is room to wonder whether that explains the attention it gets from the more poporiented evolutionary psychologists. The leading light in this area is David Buss, or "The Doctor of Love", as he is fondly termed on "The Evolutionist" web page. Mr. Buss also explains that potential pick-ups start looking better as closing-time nears and worse again after sex. Well, maybe that is all so, and perhaps it has something to do with the evolutionary roles of the sexes. But Mr. Buss tells you little about the precise mechanism behind the behaviour. Defenders of evolutionary psychology may reasonably reply that there are better practitioners than Mr. Buss and more impressive examples of Darwinian accounts of human mental phenomena than singles-bar behaviour. Yet even the best samples of the evolutionary approach raise the question of its explanatory goal. Do the different examples, plucked here and there from the vast field of human mental life and behaviour, show promise of ever adding up to a coherent theory of the mind?

That question brings in the second main worry about evolutionary psychology: by emphasizing the modules it leaves out the important part of the mind. Evolutionary psychologists often liken the mind to a Swiss Army knife. It contains a large number of purpose-built tools, each designed for a quite specific purpose. But this picture prompts an obvious question. Who, or what, is deciding when to open which blades? Don't you need some central intelligence to orchestrate the overall operation? Some evolutionary psychologists say no. But, while that may be true of other animals, it makes little sense for humans. For one thing, you seem to need a central intelligence to understand human moral reasoning. Even if your modules incline you towards sexual and racial discrimination, for example, it does not follow that such discrimination is either inevitable or justified. If humans are just a collection of modular reflexes, how is it that they can correct their inclinations? Humans seem to need some mental faculty that can stand back from modular promptings and tell them how to do better.

There are less elevated examples of people monitoring the outputs of their purpose-specific mental modules. You are often quite aware that your visual system is fooling you: for example, when you look at trick drawings, or indeed when you watch television. If it is possible to question modular inclinations in this way, there must be some place in the mind which transcends the modules.

To insist that there is more to the mind than modules is not to deny humans' animal heritage: no doubt a person's central intelligence is itself an evolutionary product of the past. But it does mean that evolutionary psychology, like its predecessors, is in danger of ignoring the very thing that makes humans different from other animals. Perhaps evolutionary psychologists will soon shift their focus away from peripheral modules, and start contributing to an understanding of the really hard biological problem of the structure and function of the central intellectual abilities. Until then, they are unlikely to shed more than a sidelight on the human mind or to show people much about why they live the way they do.

What is the author trying to convey through the phrase, "incitement to fabulation"?

A. inciting theorists to make fabulous claims
B. resulting in stories and fables
C. resulting in wrong claims
D. none of these

cat1995 english-language passage-reading multiple-sub-parts

### 5.11.4 Multiple Sub Parts: CAT 1995 | Question: 104 top

Read the passages and answer the questions that follow:

Darwinian enthusiasts are too quick to read historical purposes into every biological trait. In Stephen Jay Gould's telling phrase, they are overly fond of 'just-so stories", which differ from Kipling's fables only in their lack of good jokes. Mr. Gould's immediate target here is "selfish-gene" theorists like Richard Dawkins, and it is a moot point whether he actually hits that mark. But, whatever you think of Mr. Dawkins, evolutionary psychology is indeed open to the just-so charge. In principle it may seem a good idea for psychology and evolutionary theory to pool their intellectual resources. But given the paucity of hard evidence on each side, the merger often seems to achieve little more than an incitement to fabulation.

The trouble is not just that human brains leave no fossils, though this is certainly one problem. Just as hazardous is the lack of definite knowledge about current mental mechanisms. This makes it all too tempting to put evolutionary speculation in the place of hard psychological evidence, and so conjure mental modules out of historical myth. Take Ms Cosmides's theory about the evolution of a cheater-detection module. This is now widely accepted. But thereis no independent evidence, apart from Ms Cosmides's psychological experiments, for this historical story. Moreover, other psychologists now claim to have performed new experiments which show that a cheating factor is not the crucial variable in the Wason selection task after all. Less indulgent critics will say that the flirtation with evolution has simply led Ms Cosmides up a theoretical blind alley.

A similar charge can be leveled at other prize exhibits in the gallery of evolutionary psychology. The theories of human altruism described in Mr. Ridley's "The Origins of Virtue" involve any number of plausible ideas about the social practices of our hominid forefathers. But there is no real historical basis for these parables, and precious little direct evidence that today's humans display any corresponding dispositions. The ideas in Mr. Ridley's book exhibit game-theoretical sophistication and

much ingenuity, and are worth reading for that reason alone, but they scarcely qualify as reliable science.

Then there is sex. Reproduction is centra1 to evolution, but there is room to wonder whether that explains the attention it gets from the more poporiented evolutionary psychologists. The leading light in this area is David Buss, or "The Doctor of Love", as he is fondly termed on "The Evolutionist" web page. His book, "The Evolution of Desire" reports the results of a questionnaire given to 10, 000 people in 37 countries. In every country, women like rich men, and men like young attractive women. Mr. Buss also explains that potential pick-ups start looking better as closing-time nears and worse again after sex. Well, maybe that is all so, and perhaps it has something to do with the evolutionary roles of the sexes. But Mr. Buss tells you little about the precise mechanism behind the behaviour. Defenders of evolutionary psychology may reasonably reply that there are better practitioners than Mr. Buss and more impressive examples of Darwinian accounts of human mental phenomena than singles-bar behaviour. Yet even the best samples of the evolutionary approach raise the question of its explanatory goal. Do the different examples, plucked here and there from the vast field of human mental life and behaviour, show promise of ever adding up to a coherent theory of the mind?

That question brings in the second main worry about evolutionary psychology: by emphasizing the modules it leaves out the important part of the mind. Evolutionary psychologists often liken the mind to a Swiss Army knife. It contains a large number of purpose-built tools, each designed for a quite specific purpose. But this picture prompts an obvious question. Who, or what, is deciding when to open which blades? Don't you need some central intelligence to orchestrate the overall operation? Some evolutionary psychologists say no. But, while that may be true of other animals, it makes little sense for humans. For one thing, you seem to need a central intelligence to understand human moral reasoning. Even if your modules incline you towards sexual and racial discrimination, for example, it does not follow that such discrimination is either inevitable or justified. If humans are just a collection of modular reflexes, how is it that they can correct their inclinations? Humans seem to need some mental faculty that can stand back from modular promptings and tell them how to do better.

There are less elevated examples of people monitoring the outputs of their purpose-specific mental modules. You are often quite aware that your visual system is fooling you: for example, when you look at trick drawings, or indeed when you watch television. If it is possible to question modular inclinations in this way, there must be some place in the mind which transcends the modules.

To insist that there is more to the mind than modules is not to deny humans' animal heritage: no doubt a person's central intelligence is itself an evolutionary product of the past. But it does mean that evolutionary psychology, like its predecessors, is in danger of ignoring the very thing that makes humans different from other animals. Perhaps evolutionary psychologists will soon shift their focus away from peripheral modules, and start contributing to an understanding of the really hard biological problem of the structure and function of the central intellectual abilities. Until then, they are unlikely to shed more than a sidelight on the human mind or to show people much about why they live the way they do.

Mr. Cosmides' theory about evolution:

A. is now widely accepted
B. is just a historical myth
C. lacks psychological evidence
D. is a theoretical blind alley

cat1995 english-language passage-reading multiple-sub-parts

## 5.11.5 Multiple Sub Parts: CAT 1995 | Question: 105 top

Read the passages and answer the questions that follow:

Darwinian enthusiasts are too quick to read historical purposes into every biological trait. In Stephen Jay Gould's telling phrase, they are overly fond of 'just-so stories", which differ from Kipling's fables only in their lack of good jokes. Mr. Gould's immediate target here is "selfish-gene" theorists like Richard Dawkins, and it is a moot point whether he actually hits that mark. But, whatever you think of Mr. Dawkins, evolutionary psychology is indeed open to the just-so charge. In principle it may seem a good idea for psychology and evolutionary theory to pool their intellectual resources. But given the paucity of hard evidence on each side, the merger often seems to achieve little more than an incitement to fabulation.

The trouble is not just that human brains leave no fossils, though this is certainly one problem. Just as hazardous is the lack of definite knowledge about current mental mechanisms. This makes it all too tempting to put evolutionary speculation in the place of hard psychological evidence, and so conjure mental modules out of historical myth. Take Ms Cosmides's theory about the evolution of a cheater-detection module. This is now widely accepted. But thereis no independent evidence, apart from Ms Cosmides's psychological experiments, for this historical story. Moreover, other psychologists now claim to have performed new experiments which show that a cheating factor is not the crucial variable in the Wason selection task after all. Less indulgent critics will say that the flirtation with evolution has simply led Ms Cosmides up a theoretical blind alley.

A similar charge can be leveled at other prize exhibits in the gallery of evolutionary psychology. The theories of human altruism described in Mr. Ridley's "The Origins of Virtue" involve any number of plausible ideas about the social practices of our hominid forefathers. But there is no real historical basis for these parables, and precious little direct evidence that today's humans display any corresponding dispositions. The ideas in Mr. Ridley's book exhibit game-theoretical sophistication and much ingenuity, and are worth reading for that reason alone, but they scarcely qualify as reliable science.

Then there is sex. Reproduction is centra1 to evolution, but there is room to wonder whether that explains the attention it gets from the more poporiented evolutionary psychologists. The leading light in this area is David Buss, or "The Doctor of Love",

as he is fondly termed on “The Evolutionist” web page. His book, “The Evolution of Desire” reports the results of a questionnaire given to 10, 000 people in 37 countries. In every country, women like rich men, and men like young attractive women. Mr. Buss also explains that potential pick-ups start looking better as closing-time nears and worse again after sex. Well, maybe that is all so, and perhaps it has something to do with the evolutionary roles of the sexes. But Mr. Buss tells you little about the precise mechanism behind the behaviour. Defenders of evolutionary psychology may reasonably reply that there are better practitioners than Mr. Buss and more impressive examples of Darwinian accounts of human mental phenomena than singles-bar behaviour. Yet even the best samples of the evolutionary approach raise the question of its explanatory goal. Do the different examples, plucked here and there from the vast field of human mental life and behaviour, show promise of ever adding up to a coherent theory of the mind?

That question brings in the second main worry about evolutionary psychology: by emphasizing the modules it leaves out the important part of the mind. Evolutionary psychologists often liken the mind to a Swiss Army knife. It contains a large number of purpose-built tools, each designed for a quite specific purpose. But this picture prompts an obvious question. Who, or what, is deciding when to open which blades? Don’t you need some central intelligence to orchestrate the overall operation? Some evolutionary psychologists say no. But, while that may be true of other animals, it makes little sense for humans. For one thing, you seem to need a central intelligence to understand human moral reasoning. Even if your modules incline you towards sexual and racial discrimination, for example, it does not follow that such discrimination is either inevitable or justified. If humans are just a collection of modular reflexes, how is it that they can correct their inclinations? Humans seem to need some mental faculty that can stand back from modular promptings and tell them how to do better.

There are less elevated examples of people monitoring the outputs of their purpose-specific mental modules. You are often quite aware that your visual system is fooling you: for example, when you look at trick drawings, or indeed when you watch television. If it is possible to question modular inclinations in this way, there must be some place in the mind which transcends the modules.

To insist that there is more to the mind than modules is not to deny humans’ animal heritage: no doubt a person’s central intelligence is itself an evolutionary product of the past. But it does mean that evolutionary psychology, like its predecessors, is in danger of ignoring the very thing that makes humans different from other animals. Perhaps evolutionary psychologists will soon shift their focus away from peripheral modules, and start contributing to an understanding of the really hard biological problem of the structure and function of the central intellectual abilities. Until then, they are unlikely to shed more than a sidelight on the human mind or to show people much about why they live the way they do.

'David Buss’ contribution to the evolutionary approach:

A. is an important contribution to understand evolution
B. does not explain much about evolution
C. is an example of pop-oriented evolutionary psychology
D. has added important statistical research consisting of 10, 000 people in 37 countries.

cat1995 english-language passage-reading multiple-sub-parts

## 5.11.6 Multiple Sub Parts: CAT 1995 | Question: 106 top

Read the passages and answer the questions that follow:

Darwinian enthusiasts are too quick to read historical purposes into every biological trait. In Stephen Jay Gould’s telling phrase, they are overly fond of ‘just-so stories”, which differ from Kipling’s fables only in their lack of good jokes. Mr. Gould’s immediate target here is “selfish-gene” theorists like Richard Dawkins, and it is a moot point whether he actually hits that mark. But, whatever you think of Mr. Dawkins, evolutionary psychology is indeed open to the just-so charge. In principle it may seem a good idea for psychology and evolutionary theory to pool their intellectual resources. But given the paucity of hard evidence on each side, the merger often seems to achieve little more than an incitement to fabulation.

The trouble is not just that human brains leave no fossils, though this is certainly one problem. Just as hazardous is the lack of definite knowledge about current mental mechanisms. This makes it all too tempting to put evolutionary speculation in the place of hard psychological evidence, and so conjure mental modules out of historical myth. Take Ms Cosmides’s theory about the evolution of a cheater-detection module. This is now widely accepted. But thereis no independent evidence, apart from Ms Cosmides’s psychological experiments, for this historical story. Moreover, other psychologists now claim to have performed new experiments which show that a cheating factor is not the crucial variable in the Wason selection task after all. Less indulgent critics will say that the flirtation with evolution has simply led Ms Cosmides up a theoretical blind alley.

A similar charge can be leveled at other prize exhibits in the gallery of evolutionary psychology. The theories of human altruism described in Mr. Ridley’s “The Origins of Virtue” involve any number of plausible ideas about the social practices of our hominid forefathers. But there is no real historical basis for these parables, and precious little direct evidence that today’s humans display any corresponding dispositions. The ideas in Mr. Ridley’s book exhibit game-theoretical sophistication and much ingenuity, and are worth reading for that reason alone, but they scarcely qualify as reliable science.

Then there is sex. Reproduction is centra1 to evolution, but there is room to wonder whether that explains the attention it gets from the more poporiented evolutionary psychologists. The leading light in this area is David Buss, or “The Doctor of Love”, as he is fondly termed on “The Evolutionist” web page. His book, “The Evolution of Desire” reports the results of a

questionnaire given to 10, 000 people in 37 countries. In every country, women like rich men, and men like young attractive women. Mr. Buss also explains that potential pick-ups start looking better as closing-time nears and worse again after sex. Well, maybe that is all so, and perhaps it has something to do with the evolutionary roles of the sexes. But Mr. Buss tells you little about the precise mechanism behind the behaviour. Defenders of evolutionary psychology may reasonably reply that there are better practitioners than Mr. Buss and more impressive examples of Darwinian accounts of human mental phenomena than singles-bar behaviour. Yet even the best samples of the evolutionary approach raise the question of its explanatory goal. Do the different examples, plucked here and there from the vast field of human mental life and behaviour, show promise of ever adding up to a coherent theory of the mind?

That question brings in the second main worry about evolutionary psychology: by emphasizing the modules it leaves out the important part of the mind. Evolutionary psychologists often liken the mind to a Swiss Army knife. It contains a large number of purpose-built tools, each designed for a quite specific purpose. But this picture prompts an obvious question. Who, or what, is deciding when to open which blades? Don't you need some central intelligence to orchestrate the overall operation? Some evolutionary psychologists say no. But, while that may be true of other animals, it makes little sense for humans. For one thing, you seem to need a central intelligence to understand human moral reasoning. Even if your modules incline you towards sexual and racial discrimination, for example, it does not follow that such discrimination is either inevitable or justified. If humans are just a collection of modular reflexes, how is it that they can correct their inclinations? Humans seem to need some mental faculty that can stand back from modular promptings and tell them how to do better.

There are less elevated examples of people monitoring the outputs of their purpose-specific mental modules. You are often quite aware that your visual system is fooling you: for example, when you look at trick drawings, or indeed when you watch television. If it is possible to question modular inclinations in this way, there must be some place in the mind which transcends the modules.

To insist that there is more to the mind than modules is not to deny humans' animal heritage: no doubt a person's central intelligence is itself an evolutionary product of the past. But it does mean that evolutionary psychology, like its predecessors, is in danger of ignoring the very thing that makes humans different from other animals. Perhaps evolutionary psychologists will soon shift their focus away from peripheral modules, and start contributing to an understanding of the really hard biological problem of the structure and function of the central intellectual abilities. Until then, they are unlikely to shed more than a sidelight on the human mind or to show people much about why they live the way they do.

The problem with treating the mind as a module is that:

A. it ignores how the mind actually functions
B. it ignores the fact that a mental faculty controls modular prompting
C. it treats everything in compartments
D. it does not explain visual tricks such as television

### 5.11.7 Multiple Sub Parts: CAT 1995 | Question: 107 top

Read the passages and answer the questions that follow:

Darwinian enthusiasts are too quick to read historical purposes into every biological trait. In Stephen Jay Gould's telling phrase, they are overly fond of 'just-so stories", which differ from Kipling's fables only in their lack of good jokes. Mr. Gould's immediate target here is "selfish-gene" theorists like Richard Dawkins, and it is a moot point whether he actually hits that mark. But, whatever you think of Mr. Dawkins, evolutionary psychology is indeed open to the just-so charge. In principle it may seem a good idea for psychology and evolutionary theory to pool their intellectual resources. But given the paucity of hard evidence on each side, the merger often seems to achieve little more than an incitement to fabulation.

The trouble is not just that human brains leave no fossils, though this is certainly one problem. Just as hazardous is the lack of definite knowledge about current mental mechanisms. This makes it all too tempting to put evolutionary speculation in the place of hard psychological evidence, and so conjure mental modules out of historical myth. Take Ms Cosmides's theory about the evolution of a cheater-detection module. This is now widely accepted. But thereis no independent evidence, apart from Ms Cosmides's psychological experiments, for this historical story. Moreover, other psychologists now claim to have performed new experiments which show that a cheating factor is not the crucial variable in the Wason selection task after all. Less indulgent critics will say that the flirtation with evolution has simply led Ms Cosmides up a theoretical blind alley.

A similar charge can be leveled at other prize exhibits in the gallery of evolutionary psychology. The theories of human altruism described in Mr. Ridley's "The Origins of Virtue" involve any number of plausible ideas about the social practices of our hominid forefathers. But there is no real historical basis for these parables, and precious little direct evidence that today's humans display any corresponding dispositions. The ideas in Mr. Ridley's book exhibit game-theoretical sophistication and much ingenuity, and are worth reading for that reason alone, but they scarcely qualify as reliable science.

Then there is sex. Reproduction is centra1 to evolution, but there is room to wonder whether that explains the attention it gets from the more poporiented evolutionary psychologists. The leading light in this area is David Buss, or "The Doctor of Love", as he is fondly termed on "The Evolutionist" web page. His book, "The Evolution of Desire" reports the results of a questionnaire given to 10, 000 people in 37 countries. In every country, women like rich men, and men like young attractive

women. Mr. Buss also explains that potential pick-ups start looking better as closing-time nears and worse again after sex. Well, maybe that is all so, and perhaps it has something to do with the evolutionary roles of the sexes. But Mr. Buss tells you little about the precise mechanism behind the behaviour. Defenders of evolutionary psychology may reasonably reply that there are better practitioners than Mr. Buss and more impressive examples of Darwinian accounts of human mental phenomena than singles-bar behaviour. Yet even the best samples of the evolutionary approach raise the question of its explanatory goal. Do the different examples, plucked here and there from the vast field of human mental life and behaviour, show promise of ever adding up to a coherent theory of the mind?

That question brings in the second main worry about evolutionary psychology: by emphasizing the modules it leaves out the important part of the mind. Evolutionary psychologists often liken the mind to a Swiss Army knife. It contains a large number of purpose-built tools, each designed for a quite specific purpose. But this picture prompts an obvious question. Who, or what, is deciding when to open which blades? Don't you need some central intelligence to orchestrate the overall operation? Some evolutionary psychologists say no. But, while that may be true of other animals, it makes little sense for humans. For one thing, you seem to need a central intelligence to understand human moral reasoning. Even if your modules incline you towards sexual and racial discrimination, for example, it does not follow that such discrimination is either inevitable or justified. If humans are just a collection of modular reflexes, how is it that they can correct their inclinations? Humans seem to need some mental faculty that can stand back from modular promptings and tell them how to do better.

There are less elevated examples of people monitoring the outputs of their purpose-specific mental modules. You are often quite aware that your visual system is fooling you: for example, when you look at trick drawings, or indeed when you watch television. If it is possible to question modular inclinations in this way, there must be some place in the mind which transcends the modules.

To insist that there is more to the mind than modules is not to deny humans' animal heritage: no doubt a person's central intelligence is itself an evolutionary product of the past. But it does mean that evolutionary psychology, like its predecessors, is in danger of ignoring the very thing that makes humans different from other animals. Perhaps evolutionary psychologists will soon shift their focus away from peripheral modules, and start contributing to an understanding of the really hard biological problem of the structure and function of the central intellectual abilities. Until then, they are unlikely to shed more than a sidelight on the human mind or to show people much about why they live the way they do.

The conclusion of the article is that:

A. Evolutionary psychology ignores the very thing that makes humans different from animals
B. Evolutionary psychology is unlikely to shed more than a sidelight on the human mind.
C. Evolutionary psychology can explain an important aspect if it explains the structure and function of the central intellectual abilities
D. Evolutionary psychology has a limited future, as of date.

cat1995 english-language passage-reading multiple-sub-parts

### 5.11.8 Multiple Sub Parts: CAT 1995 | Question: 108 top

Read the passages and answer the questions that follow:

Darwinian enthusiasts are too quick to read historical purposes into every biological trait. In Stephen Jay Gould's telling phrase, they are overly fond of 'just-so stories", which differ from Kipling's fables only in their lack of good jokes. Mr. Gould's immediate target here is "selfish-gene" theorists like Richard Dawkins, and it is a moot point whether he actually hits that mark. But, whatever you think of Mr. Dawkins, evolutionary psychology is indeed open to the just-so charge. In principle it may seem a good idea for psychology and evolutionary theory to pool their intellectual resources. But given the paucity of hard evidence on each side, the merger often seems to achieve little more than an incitement to fabulation.

The trouble is not just that human brains leave no fossils, though this is certainly one problem. Just as hazardous is the lack of definite knowledge about current mental mechanisms. This makes it all too tempting to put evolutionary speculation in the place of hard psychological evidence, and so conjure mental modules out of historical myth. Take Ms Cosmides's theory about the evolution of a cheater-detection module. This is now widely accepted. But thereis no independent evidence, apart from Ms Cosmides's psychological experiments, for this historical story. Moreover, other psychologists now claim to have performed new experiments which show that a cheating factor is not the crucial variable in the Wason selection task after all. Less indulgent critics will say that the flirtation with evolution has simply led Ms Cosmides up a theoretical blind alley.

A similar charge can be leveled at other prize exhibits in the gallery of evolutionary psychology. The theories of human altruism described in Mr. Ridley's "The Origins of Virtue" involve any number of plausible ideas about the social practices of our hominid forefathers. But there is no real historical basis for these parables, and precious little direct evidence that today's humans display any corresponding dispositions. The ideas in Mr. Ridley's book exhibit game-theoretical sophistication and much ingenuity, and are worth reading for that reason alone, but they scarcely qualify as reliable science.

Then there is sex. Reproduction is centra1 to evolution, but there is room to wonder whether that explains the attention it gets from the more poporiented evolutionary psychologists. The leading light in this area is David Buss, or "The Doctor of Love", as he is fondly termed on "The Evolutionist" web page. His book, "The Evolution of Desire" reports the results of a

questionnaire given to 10, 000 people in 37 countries. In every country, women like rich men, and men like young attractive women. Mr. Buss also explains that potential pick-ups start looking better as closing-time nears and worse again after sex. Well, maybe that is all so, and perhaps it has something to do with the evolutionary roles of the sexes. But Mr. Buss tells you little about the precise mechanism behind the behaviour. Defenders of evolutionary psychology may reasonably reply that there are better practitioners than Mr. Buss and more impressive examples of Darwinian accounts of human mental phenomena than singles-bar behaviour. Yet even the best samples of the evolutionary approach raise the question of its explanatory goal. Do the different examples, plucked here and there from the vast field of human mental life and behaviour, show promise of ever adding up to a coherent theory of the mind?

That question brings in the second main worry about evolutionary psychology: by emphasizing the modules it leaves out the important part of the mind. Evolutionary psychologists often liken the mind to a Swiss Army knife. It contains a large number of purpose-built tools, each designed for a quite specific purpose. But this picture prompts an obvious question. Who, or what, is deciding when to open which blades? Don't you need some central intelligence to orchestrate the overall operation? Some evolutionary psychologists say no. But, while that may be true of other animals, it makes little sense for humans. For one thing, you seem to need a central intelligence to understand human moral reasoning. Even if your modules incline you towards sexual and racial discrimination, for example, it does not follow that such discrimination is either inevitable or justified. If humans are just a collection of modular reflexes, how is it that they can correct their inclinations? Humans seem to need some mental faculty that can stand back from modular promptings and tell them how to do better.

There are less elevated examples of people monitoring the outputs of their purpose-specific mental modules. You are often quite aware that your visual system is fooling you: for example, when you look at trick drawings, or indeed when you watch television. If it is possible to question modular inclinations in this way, there must be some place in the mind which transcends the modules.

To insist that there is more to the mind than modules is not to deny humans' animal heritage: no doubt a person's central intelligence is itself an evolutionary product of the past. But it does mean that evolutionary psychology, like its predecessors, is in danger of ignoring the very thing that makes humans different from other animals. Perhaps evolutionary psychologists will soon shift their focus away from peripheral modules, and start contributing to an understanding of the really hard biological problem of the structure and function of the central intellectual abilities. Until then, they are unlikely to shed more than a sidelight on the human mind or to show people much about why they live the way they do.

The article is an attempt to:

A. explain evolutionary psychology

B. discuss the contribution of evolutionary psychologists

C. downgrade the contribution of psychologists

D. none of these

cat1995 english-language passage-reading multiple-sub-parts

## 5.11.9 Multiple Sub Parts: CAT 1995 | Question: 109 top

Read the passages and answer the questions that follow:

It sounds pretty obvious: life is all a game. Charles Lamb (1775 − 1834) put it rather elegantly: "Man is a gaming animal. He must always be trying to get the better in something or other." What John Harsanyi and other economists did was to apply mathematical Logic to this human urge and make game theory, as it is called, part of the ir tool kit. At its humblest level, game theory is useful in saving the players from going mad. In devising a strategy you know that your rival may know what you are planning, and he knows that you know he knows, and soon.... even skilled chessplayers can feel mentally wounded.

In chess and comparable real-life games, each side has basic information about the other. The problem of Charles Lamb's gaming animals is that they usually have imperfect knowledge about their opponents. They guessed, or relied on "intuition" or, as Napoleon said of his favorite generals, they were lucky. Until quite recent items, this was the way countries and great companies dealt with their rivals.

Mr. Harsanyi's contribution to game theory was to show that such games need not be played in a fog, or at least not much. It was possible to analyze such games and provide guidance about the probable moves and their outcomes. This advanced game theory was employed, at least by the Americans, in their negotiations with the Soviet Union on arms control. Kennedy and Khrushchev used game theory in their tussle over Cuban missiles in 1962.

Game theory is widely used in commerce, as happened this year when, with great success, the British government sold licenses for mobile phone services in an auction designed by an Oxford economist. Paul Kemmerer. Some economists are watching with fascination the contest between the European Central Bank and the currency market over the future of the Europe, which has at least the look of an exercise in game theory. A Dutch team of economists applied the theory to international football and concluded that a bad team playing at home is more likely to score than a good one playing away. One effect of game theory is to make economists seem quite human.

As often happens when an idea becomes fashionable, there has been some argument about who first thought to game theory. Mr. Harsanyi, who shared a Nobel Prize in 1994 with two other economists in the same field, John Nash and Reinhardt Selten, was happy to acknowledge that game theory had been around in some form for a longtime. Players of poker, and of course chess, had been using game theory without calling it that. Philosophy has a claim: it seeks to rationalize the behaviour of people with conflicting interests. As a young man in Budapest, Mr. Harsanyi had studied philosophy and mathematics and, to

please his parents who ran a pharmacy, he added chemistry.

What triggered his interest in game theory appears to have been the work of John von Neumann and Oskar Morgenstern, who in 1944 published a book entitled "The Theory of Games and Economic Behaviour". Von Neumann was an American mathematician who, by coincidence, had also been born in Hungary and had attended the same school as Mr. Harsanyi. He and Morgenstern may have been the first to show how the philosophical idea of rational behaviour could be applied to economics. They did not develop the idea. In his short life, von Neumann especially had much other interest, including work on quantum theory and the design of the first electronic computers. In paper after paper, Mr. Harsanyi and his colleagues took the theory further. It is still being polished.

The philosopher in John Harsanyi saw in game theory means of improving the human condition. He promoted the idea that the rightness or wrongness of an action depended on its consequences. An ethical theory known as utilitarianism. The connection between game theory and ethics is a complex one. His book on this theme, Essays on Ethics. Social Behaviour and Scientific Explanation", is a hard read, just as game theory it self demands lots of tricky mathematics. No one would blame you for sticking to Charles Lamb.

What is the author meaning to convey when he says, "even skilled chess-players can feel mentally wounded"?

A. it saves the players from going mad
B. the mathematical logic of the game theory leaves even skilled players wounded
C. that the theory is very complicated
D. chess players find the theory hard to comprehend

## 5.11.10 Multiple Sub Parts: CAT 1995 | Question: 110 top

Read the passages and answer the questions that follow:

It sounds pretty obvious: life is all a game. Charles Lamb (1775 − 1834) put it rather elegantly: "Man is a gaming animal. He must always be trying to get the better in something or other." What John Harsanyi and other economists did was to apply mathematical Logic to this human urge and make game theory, as it is called, part of the ir tool kit. At its humblest level, game theory is useful in saving the players from going mad. In devising a strategy you know that your rival may know what you are planning, and he knows that you know he knows, and soon.... even skilled chessplayers can feel mentally wounded.

In chess and comparable real-life games, each side has basic information about the other. The problem of Charles Lamb's gaming animals is that they usually have imperfect knowledge about their opponents. They guessed, or relied on "intuition" or, as Napoleon said of his favorite generals, they were lucky. Until quite recent items, this was the way countries and great companies dealt with their rivals.

Mr. Harsanyi's contribution to game theory was to show that such games need not be played in a fog, or at least not much. It was possible to analyze such games and provide guidance about the probable moves and their outcomes. This advanced game theory was employed, at least by the Americans, in their negotiations with the Soviet Union on arms control. Kennedy and Khrushchev used game theory in their tussle over Cuban missiles in 1962.

Game theory is widely used in commerce, as happened this year when, with great success, the British government sold licenses for mobile phone services in an auction designed by an Oxford economist. Paul Kemmerer. Some economists are watching with fascination the contest between the European Central Bank and the currency market over the future of the Europe, which has at least the look of an exercise in game theory. A Dutch team of economists applied the theory to international football and concluded that a bad team playing at home is more likely to score than a good one playing away. One effect of game theory is to make economists seem quite human.

As often happens when an idea becomes fashionable, there has been some argument about who first thought to game theory. Mr. Harsanyi, who shared a Nobel Prize in 1994 with two other economists in the same field, John Nash and Reinhardt Selten, was happy to acknowledge that game theory had been around in some form for a longtime. Players of poker, and of course chess, had been using game theory without calling it that. Philosophy has a claim: it seeks to rationalize the behaviour of people with conflicting interests. As a young man in Budapest, Mr. Harsanyi had studied philosophy and mathematics and, to please his parents who ran a pharmacy, he added chemistry.

What triggered his interest in game theory appears to have been the work of John von Neumann and Oskar Morgenstern, who in 1944 published a book entitled "The Theory of Games and Economic Behaviour". Von Neumann was an American mathematician who, by coincidence, had also been born in Hungary and had attended the same school as Mr. Harsanyi. He and Morgenstern may have been the first to show how the philosophical idea of rational behaviour could be applied to economics. They did not develop the idea. In his short life, von Neumann especially had much other interest, including work on quantum theory and the design of the first electronic computers. In paper after paper, Mr. Harsanyi and his colleagues took the theory further. It is still being polished.

The philosopher in John Harsanyi saw in game theory means of improving the human condition. He promoted the idea that the rightness or wrongness of an action depended on its consequences. An ethical theory known as utilitarianism. The connection between game theory and ethics is a complex one. His book on this theme, Essays on Ethics. Social Behaviour and Scientific Explanation", is a hard read, just as game theory it self demands lots of tricky mathematics. No one would blame you for

sticking to Charles Lamb.

The author feels that prior to game theory, companies and countries:

A. relied on guess work when dealing with each other
B. relied on luck rather than scientific analysis
C. made imperfect decisions
D. had no idea how to deal with each other

## 5.11.14 Multiple Sub Parts: CAT 1995 | Question: 114 top

Read the passages and answer the questions that follow:

It sounds pretty obvious: life is all a game. Charles Lamb (1775 − 1834) put it rather elegantly: “Man is a gaming animal. He must always be trying to get the better in something or other.” What John Harsanyi and other economists did was to apply mathematical Logic to this human urge and make game theory, as it is called, part of the ir tool kit. At its humblest level, game theory is useful in saving the players from going mad. In devising a strategy you know that your rival may know what you are planning, and he knows that you know he knows, and soon.... even skilled chessplayers can feel mentally wounded.

In chess and comparable real-life games, each side has basic information about the other. The problem of Charles Lamb’s gaming animals is that they usually have imperfect knowledge about their opponents. They guessed, or relied on “intuition” or, as Napoleon said of his favorite generals, they were lucky. Until quite recent items, this was the way countries and great companies dealt with their rivals.

Mr. Harsanyi’s contribution to game theory was to show that such games need not be played in a fog, or at least not much. It was possible to analyze such games and provide guidance about the probable moves and their outcomes. This advanced game theory was employed, at least by the Americans, in their negotiations with the Soviet Union on arms control. Kennedy and Khrushchev used game theory in their tussle over Cuban missiles in 1962.

Game theory is widely used in commerce, as happened this year when, with great success, the British government sold licenses for mobile phone services in an auction designed by an Oxford economist. Paul Kemmerer. Some economists are watching with fascination the contest between the European Central Bank and the currency market over the future of the Europe, which has at least the look of an exercise in game theory. A Dutch team of economists applied the theory to international football and concluded that a bad team playing at home is more likely to score than a good one playing away. One effect of game theory is to make economists seem quite human.

As often happens when an idea becomes fashionable, there has been some argument about who first thought to game theory. Mr. Harsanyi, who shared a Nobel Prize in 1994 with two other economists in the same field, John Nash and Reinhardt Selten, was happy to acknowledge that game theory had been around in some form for a longtime. Players of poker, and of course chess, had been using game theory without calling it that. Philosophy has a claim: it seeks to rationalize the behaviour of people with conflicting interests. As a young man in Budapest, Mr. Harsanyi had studied philosophy and mathematics and, to

please his parents who ran a pharmacy, he added chemistry.

What triggered his interest in game theory appears to have been the work of John von Neumann and Oskar Morgenstern, who i n 1944 published a book entitled "The Theory of Games and Economic Behaviour". Von Neumann was an American mathematician who, by coincidence, had also been born in Hungary and had attended the same school as Mr. Harsanyi. He and Morgenstern may have been the first to show how the philosophical idea of rational behaviour could be applied to economics. They did not develop the idea. In his short life, von Neumann especially had much other interest, including work on quantum theory and the design of the first electronic computers. In paper after paper, Mr. Harsanyi and his colleagues took the theory further. It is still being polished.

The philosopher in John Harsanyi saw in game theory means of improving the human condition. He promoted the idea that the rightness or wrongness of an action depended on its consequences. An ethical theory known as utilitarianism. The connection between game theory and ethics is a complex one. His book on this theme, Essays on Ethics. Social Behaviour and Scientific Explanation", is a hard read, just as game theory it self demands lots of tricky mathematics. No one would blame you for sticking to Charles Lamb.

The passage is a/an:

A. review of a book written by Mr. Harsanyi
B. assessment of the work of Mr. Harsanyi
C. summation of the game theory
D. explanation of the game theory

cat1995 english-language passage-reading multiple-sub-parts

## 5.11.15 Multiple Sub Parts: CAT 1995 | Question: 115 top

Read the passages and answer the questions that follow:

Even as its rivals have been battered by the cyclical downturn in petrochemicals and by Asia's financial troubles, Reliance has gone from strength to strength. Its latest results show a robust 18% rise in net profits and a 37% rise in sales over the same period a year earlier. Average annual growth in the firm's sales since it went public has been over 25%.

The way in which Reliance has achieved such results is, however, rather less impressive. Its success has arisen largely from its iron grip on its home market, source of 05% of its revenues—a grip that it retains in part through close links with Indian politicians.

From its very beginning, Dhirubhai Ambani. the firm's founder, wooed politicians to secure the licences he needed to expand his business from a small textile concern into a big petrochemical one. Many analysts suggest that the Ambani family (Dhirubhai's Sons Mukesh and Anil, who attended American. business schools, run most things today) has advanced largely thanks to such contacts. "The first call the mandarins in Delhi make after every cabinet meeting is to Reliance" claims one

The firm has benefited from a curiously favorable regulatory regime. For example, it pays very little income tax (1997 was the first year in which it paid any). The firm has also long benefited from the Indian structure of import duties.

If Reliance owed its success only to such factors, it would be just another oligopolist using influence to compensate for inefficiency. These are, sadly, all too common in India. Shumeet Banerji of Booz, Allen and Hamilton, aconsultancy, calls India 'the Galapagos of capitalism", populated by strangely mutated firms that have adapted to the whims of the "License Ra", and could never survive in an open economy. But Reliance is more than that. The Ambanis have in fact built a thoroughly modern, efficient business.

A visit to Hazira, a parched corner of northwestern India, tells the tale more eloquently than any earnings report. The first thing you notice walking round the Reliance site there is how spiritless it is: no rubbish or legions of people hanging about. You might be in Switzerland or Delaware; not perhaps surprising, since the equipment is all the latest stuff.

In another part of the complex you see fine polyester yarn for weaving into fabrics like sarees. But do not touch: the yarn is so delicate that it is packaged by robots that whistle "Zip-Dee-Dah" as they zoom around doing the work of 700 men. Even more striking are the attitudes at Hazira. Reliance dared to build in this dusty town what was at its inception the world's largest ethylene "cracker". Despite widespread scepticism, boasts the site manger, it did so in record time. Every other employee seems to speak earnestly about how his job is "benchmarked to the wrld's best". It is this pursuit of world standards, not merely those good enough for the cosy local market, that sets Reliance apart from the flaccid family empires that still dominate Indian business. A recent study of competitiveness by Arthur D. Little, a consultancy, ranks Reliance as the most competitive firm in India and among the top ten in Asia. Paul Bernard of Goldman Sachs, an investment bank, thinks that it is the most competitive petrochemicals firm in Asia.

Mr. Ambani had the insight to realize that a firm which helped to foster India's then puny petrochemicals market could come to dominate it. In the 1980s, for example, he built a polyester plant with an annual capacity of 40, 000 tons at a time when that was equivalent to India's entire annual consumption. He integrated backwards from textiles to synthetic fibers to petrochemicals themselves. Now Reliance has gone further upstream: it is building a massive new refinery in India and it is exploring for oil.

Another consideration is the skill with which the company manages its finances. Mr. Ambani, often spurned by banks when young, was one of the first Indian industrialists to turn to small invesars for funds. The initial flotation of Reliance and its rise to capitalization of over $ 3 billion today, have made him the hero of millions of small shareholders.

It is curious that Reliance should be so well run, given that it need not be. Part of the explanation lies in the fact that the Ambanis are not like other established dynasties. Dhirubhai Ambani started out as a lowly yarn trader, and through decades of hard work forged his empire. His sons still work 12 − 14 hours a day, including weekends. Unlike many family firms, they have an experienced and long-serving team of professional mangers: over 100/0 have worked overseas, and half have worked outside the firm. Reliance pays well and, unusually for India, poaches from rival firms

In other words, Reliance has what it taken to be a world- class player. Yet ask the Ambanis about their ambitions and they do not once stray from their home turf, Mukesh Ambani talks grandly of his "endgame" of turning Reliance into an "Indian energy major". He has new ventures in telecommunications and power generation, and hopes to expand into roads, ports and other infrastructure, The only common thread, argues Manoj Badale of Monitor, an Amercan consultant who knows the firm well, is a focus on capital-intensive industries in which success turns on the ability to get round regulators—and that, it seems, is what the Ambanis reckon is Reliance's core competence.

That is a pity, and it may turn out to be bad news for Reliance. As India's petrochemicals sector liberalizes—high tariffs and other trade barriers have been falling slowly, prodded by commitments to the WTO—the day will come when Reliance must face foreign rivals on something resembling a level playing- field. Remaining ensconced in India may provide' a few more years of fat profits such as those announced recently. But it may not help to prepare Reliance for a more serious endgame: unfettered global competition.

Why does the author say that Reliance's achievement is less impressive?

A. it has an iron grip on its home market and has operated in monopoly conditions
B. it has 95% of its revenue from the home market
C. the firm has benefited from the Indian structure of import duties
D. it has used political influence for its success

cat1995 english-language passage-reading multiple-sub-parts

## 5.11.16 Multiple Sub Parts: CAT 1995 | Question: 116 top

Read the passages and answer the questions that follow:

Even as its rivals have been battered by the cyclical downturn in petrochemicals and by Asia's financial troubles, Reliance has gone from strength to strength. Its latest results show a robust 18% rise in net profits and a 37% rise in sales over the same period a year earlier. Average annual growth in the firm's sales since it went public has been over 25%.

The way in which Reliance has achieved such results is, however, rather less impressive. Its success has arisen largely from its iron grip on its home market, source of 05% of its revenues—a grip that it retains in part through close links with Indian politicians.

From its very beginning, Dhirubhai Ambani. the firm's founder, wooed politicians to secure the licences he needed to expand his business from a small textile concern into a big petrochemical one. Many analysts suggest that the Ambani family (Dhirubhai's Sons Mukesh and Anil, who attended American. business schools, run most things today) has advanced largely thanks to such contacts. "The first call the mandarins in Delhi make after every cabinet meeting is to Reliance" claims one

The firm has benefited from a curiously favorable regulatory regime. For example, it pays very little income tax (1997 was the first year in which it paid any). The firm has also long benefited from the Indian structure of import duties.

If Reliance owed its success only to such factors, it would be just another oligopolist using influence to compensate for inefficiency. These are, sadly, all too common in India. Shumeet Banerji of Booz, Allen and Hamilton, aconsultancy, calls India 'the Galapagos of capitalism", populated by strangely mutated firms that have adapted to the whims of the "License Ra", and could never survive in an open economy. But Reliance is more than that. The Ambanis have in fact built a thoroughly modern, efficient business.

A visit to Hazira, a parched corner of northwestern India, tells the tale more eloquently than any earnings report. The first thing you notice walking round the Reliance site there is how spiritless it is: no rubbish or legions of people hanging about. In another part of the complex you see fine polyester yarn for weaving into fabrics like sarees. But do not touch: the yarn is so delicate that it is packaged by robots that whistle "Zip-Dee-Dah" as they zoom around doing the work of 700 men. Even more striking are the attitudes at Hazira. Reliance dared to build in this dusty town what was at its inception the world's largest ethylene "cracker". Despite widespread scepticism, boasts the site manger, it did so in record time. Every other employee seems to speak earnestly about how his job is "benchmarked to the wrld's best". It is this pursuit of world standards, not merely those good enough for the cosy local market, that sets Reliance apart from the flaccid family empires that still dominate Indian business. A recent study of competitiveness by Arthur D. Little, a consultancy, ranks Reliance as the most competitive firm in India and among the top ten in Asia. Paul Bernard of Goldman Sachs, an investment bank, thinks that it is the most competitive petrochemicals firm in Asia.

Mr. Ambani had the insight to realize that a firm which helped to foster India's then puny petrochemicals market could come to dominate it. In the 1980s, for example, he built a polyester plant with an annual capacity of 40, 000 tons at a time when that was equivalent to India's entire annual consumption. He integrated backwards from textiles to synthetic fibers to

petrochemicals themselves. Now Reliance has gone further upstream: it is building a massive new refinery in India and it is exploring for oil.

Another consideration is the skill with which the company manages its finances. Mr. Ambani, often spurned by banks when young, was one of the first Indian industrialists to turn to small invesars for funds. The initial flotation of Reliance and its rise to capitalization of over $ 3 billion today, have made him the hero of millions of small shareholders.

It is curious that Reliance should be so well run, given that it need not be. Part of the explanation lies in the fact that the Ambanis are not like other established dynasties. Dhirubhai Ambani started out as a lowly yarn trader, and through decades of hard work forged his empire. His sons still work 12 − 14 hours a day, including weekends. Unlike many family firms, they have an experienced and long-serving team of professional mangers: over 100/0 have worked overseas, and half have worked outside the firm. Reliance pays well and, unusually for India, poaches from rival firms

In other words, Reliance has what it taken to be a world- class player. Yet ask the Ambanis about their ambitions and they do not once stray from their home turf, Mukesh Ambani talks grandly of his “endgame” of turning Reliance into an “Indian energy major”. He has new ventures in telecommunications and power generation, and hopes to expand into roads, ports and other infrastructure, The only common thread, argues Manoj Badale of Monitor, an Amercan consultant who knows the firm well, is a focus on capital-intensive industries in which success turns on the ability to get round regulators—and that, it seems, is what the Ambanis reckon is Reliance’s core competence.

That is a pity, and it may turn out to be bad news for Reliance. As India’s petrochemicals sector liberalizes—high tariffs and other trade barriers have been falling slowly, prodded by commitments to the WTO—the day will come when Reliance must face foreign rivals on something resembling a level playing- field. Remaining ensconced in India may provide’ a few more years of fat profits such as those announced recently. But it may not help to prepare Reliance for a more serious endgame: unfettered global competition.

Which of the following statements are directly made by the author?

A. the Ambani family has advanced largely due to political contacts
B. bureaucrats in Delhi call Reliance after every meeting
C. Reliance has benefited from a regulatory regime
D. all of the above

cat1995 english-language passage-reading multiple-sub-parts

## 5.11.17 Multiple Sub Parts: CAT 1995 | Question: 117 top

Read the passages and answer the questions that follow:

Even as its rivals have been battered by the cyclical downturn in petrochemicals and by Asia’s financial troubles, Reliance has gone from strength to strength. Its latest results show a robust 18% rise in net profits and a 37% rise in sales over the same period a year earlier. Average annual growth in the firm’s sales since it went public has been over 25%.

The way in which Reliance has achieved such results is, however, rather less impressive. Its success has arisen largely from its iron grip on its home market, source of 05% of its revenues—a grip that it retains in part through close links with Indian politicians.

From its very beginning, Dhirubhai Ambani. the firm’s founder, wooed politicians to secure the licences he needed to expand his business from a small textile concern into a big petrochemical one. Many analysts suggest that the Ambani family (Dhirubhai’s Sons Mukesh and Anil, who attended American. business schools, run most things today) has advanced largely thanks to such contacts. “The first call the mandarins in Delhi make after every cabinet meeting is to Reliance” claims one

The firm has benefited from a curiously favorable regulatory regime. For example, it pays very little income tax (1997 was the first year in which it paid any). The firm has also long benefited from the Indian structure of import duties.

If Reliance owed its success only to such factors, it would be just another oligopolist using influence to compensate for inefficiency. These are, sadly, all too common in India. Shumeet Banerji of Booz, Allen and Hamilton, aconsultancy, calls India ‘the Galapagos of capitalism”, populated by strangely mutated firms that have adapted to the whims of the “License Ra”, and could never survive in an open economy. But Reliance is more than that. The Ambanis have in fact built a thoroughly modern, efficient business.

A visit to Hazira, a parched corner of northwestern India, tells the tale more eloquently than any earnings report. The first thing you notice walking round the Reliance site there is how spiritless it is: no rubbish or legions of people hanging about. You might be in Switzerland or Delaware; not perhaps surprising, since the equipment is all the latest stuff.

In another part of the complex you see fine polyester yarn for weaving into fabrics like sarees. But do not touch: the yarn is so delicate that it is packaged by robots that whistle “Zip-Dee-Dah” as they zoom around doing the work of 700 men. Even more striking are the attitudes at Hazira. Reliance dared to build in this dusty town what was at its inception the world’s largest ethylene “cracker”. Despite widespread scepticism, boasts the site manger, it did so in record time. Every other employee seems to speak earnestly about how his job is “benchmarked to the wrld’s best”. It is this pursuit of world standards, not merely those good enough for the cosy local market, that sets Reliance apart from the flaccid family empires that still dominate Indian business. A recent study of competitiveness by Arthur D. Little, a consultancy, ranks Reliance as the most competitive

firm in India and among the top ten in Asia. Paul Bernard of Goldman Sachs, an investment bank, thinks that it is the most competitive petrochemicals firm in Asia.

Mr. Ambani had the insight to realize that a firm which helped to foster India's then puny petrochemicals market could come to dominate it. In the 1980s, for example, he built a polyester plant with an annual capacity of 40, 000 tons at a time when that was equivalent to India's entire annual consumption. He integrated backwards from textiles to synthetic fibers to petrochemicals themselves. Now Reliance has gone further upstream: it is building a massive new refinery in India and it is exploring for oil.

Another consideration is the skill with which the company manages its finances. Mr. Ambani, often spurned by banks when young, was one of the first Indian industrialists to turn to small invesars for funds. The initial flotation of Reliance and its rise to capitalization of over $ 3 billion today, have made him the hero of millions of small shareholders.

It is curious that Reliance should be so well run, given that it need not be. Part of the explanation lies in the fact that the Ambanis are not like other established dynasties. Dhirubhai Ambani started out as a lowly yarn trader, and through decades of hard work forged his empire. His sons still work 12 − 14 hours a day, including weekends. Unlike many family firms, they have an experienced and long-serving team of professional mangers: over 100/0 have worked overseas, and half have worked outside the firm. Reliance pays well and, unusually for India, poaches from rival firms

In other words, Reliance has what it taken to be a world- class player. Yet ask the Ambanis about their ambitions and they do not once stray from their home turf, Mukesh Ambani talks grandly of his "endgame" of turning Reliance into an "Indian energy major". He has new ventures in telecommunications and power generation, and hopes to expand into roads, ports and other infrastructure, The only common thread, argues Manoj Badale of Monitor, an Amercan consultant who knows the firm well, is a focus on capital-intensive industries in which success turns on the ability to get round regulators—and that, it seems, is what the Ambanis reckon is Reliance's core competence.

That is a pity, and it may turn out to be bad news for Reliance. As India's petrochemicals sector liberalizes—high tariffs and other trade barriers have been falling slowly, prodded by commitments to the WTO—the day will come when Reliance must face foreign rivals on something resembling a level playing- field. Remaining ensconced in India may provide' a few more years of fat profits such as those announced recently. But it may not help to prepare Reliance for a more serious endgame: unfettered global competition.

The latest results of Reliance show that:

A. it performed better than most years
B. it performed worse than most years
C. its performance has been more or less average
D. cannot say

It is curious that Reliance should be so well run, given that it need not be. Part of the explanation lies in the fact that the Ambanis are not like other established dynasties. Dhirubhai Ambani started out as a lowly yarn trader, and through decades of hard work forged his empire. His sons still work $12-14$ hours a day, including weekends. Unlike many family firms, they have an experienced and long-serving team of professional mangers: over 100/0 have worked overseas, and half have worked outside the firm. Reliance pays well and, unusually for India, poaches from rival firms

In other words, Reliance has what it taken to be a world- class player. Yet ask the Ambanis about their ambitions and they do not once stray from their home turf, Mukesh Ambani talks grandly of his "endgame" of turning Reliance into an "Indian energy major". He has new ventures in telecommunications and power generation, and hopes to expand into roads, ports and other infrastructure, The only common thread, argues Manoj Badale of Monitor, an Amercan consultant who knows the firm well, is a focus on capital-intensive industries in which success turns on the ability to get round regulators—and that, it seems, is what the Ambanis reckon is Reliance's core competence.

That is a pity, and it may turn out to be bad news for Reliance. As India's petrochemicals sector liberalizes—high tariffs and other trade barriers have been falling slowly, prodded by commitments to the WTO—the day will come when Reliance must face foreign rivals on something resembling a level playing- field. Remaining ensconced in India may provide' a few more years of fat profits such as those announced recently. But it may not help to prepare Reliance for a more serious endgame: unfettered global competition.

The difference between Reliance and other family business is that:

1. they have a team of professional mangers

2. they still work 12-14 hours a day

3. it has created world class operations.

A. 1 and 2 B. 1 and 3 C. 2 and 3 D. 1, 2 and 3

cat1995 english-language passage-reading multiple-sub-parts

## 5.11.23 Multiple Sub Parts: CAT 1995 | Question: 123 top

Read the passages and answer the questions that follow:

Even as its rivals have been battered by the cyclical downturn in petrochemicals and by Asia's financial troubles, Reliance has gone from strength to strength. Its latest results show a robust 18% rise in net profits and a 37% rise in sales over the same period a year earlier. Average annual growth in the firm's sales since it went public has been over 25%.

The way in which Reliance has achieved such results is, however, rather less impressive. Its success has arisen largely from its iron grip on its home market, source of 05% of its revenues—a grip that it retains in part through close links with Indian politicians.

From its very beginning, Dhirubhai Ambani. the firm's founder, wooed politicians to secure the licences he needed to expand his business from a small textile concern into a big petrochemical one. Many analysts suggest that the Ambani family (Dhirubhai's Sons Mukesh and Anil, who attended American. business schools, run most things today) has advanced largely thanks to such contacts. "The first call the mandarins in Delhi make after every cabinet meeting is to Reliance" claims one

The firm has benefited from a curiously favorable regulatory regime. For example, it pays very little income tax (1997 was the first year in which it paid any). The firm has also long benefited from the Indian structure of import duties.

If Reliance owed its success only to such factors, it would be just another oligopolist using influence to compensate for inefficiency. These are, sadly, all too common in India. Shumeet Banerji of Booz, Allen and Hamilton, aconsultancy, calls India 'the Galapagos of capitalism", populated by strangely mutated firms that have adapted to the whims of the "License Ra", and could never survive in an open economy. But Reliance is more than that. The Ambanis have in fact built a thoroughly modern, efficient business.

A visit to Hazira, a parched corner of northwestern India, tells the tale more eloquently than any earnings report. The first thing you notice walking round the Reliance site there is how spiritless it is: no rubbish or legions of people hanging about. You might be in Switzerland or Delaware; not perhaps surprising, since the equipment is all the latest stuff.

In another part of the complex you see fine polyester yarn for weaving into fabrics like sarees. But do not touch: the yarn is so delicate that it is packaged by robots that whistle "Zip-Dee-Dah" as they zoom around doing the work of 700 men. Even more striking are the attitudes at Hazira. Reliance dared to build in this dusty town what was at its inception the world's largest ethylene "cracker". Despite widespread scepticism, boasts the site manger, it did so in record time. Every other employee seems to speak earnestly about how his job is "benchmarked to the wrld's best". It is this pursuit of world standards, not merely those good enough for the cosy local market, that sets Reliance apart from the flaccid family empires that still dominate Indian business. A recent study of competitiveness by Arthur D. Little, a consultancy, ranks Reliance as the most competitive firm in India and among the top ten in Asia. Paul Bernard of Goldman Sachs, an investment bank, thinks that it is the most competitive petrochemicals firm in Asia.

Mr. Ambani had the insight to realize that a firm which helped to foster India's then puny petrochemicals market could come to dominate it. In the 1980s, for example, he built a polyester plant with an annual capacity of 40, 000 tons at a time when that was equivalent to India's entire annual consumption. He integrated backwards from textiles to synthetic fibers to petrochemicals themselves. Now Reliance has gone further upstream: it is building a massive new refinery in India and it is exploring for oil.

Another consideration is the skill with which the company manages its finances. Mr. Ambani, often spurned by banks when young, was one of the first Indian industrialists to turn to small invesars for funds. The initial flotation of Reliance and its rise to capitalization of over $ 3 billion today, have made him the hero of millions of small shareholders.

It is curious that Reliance should be so well run, given that it need not be. Part of the explanation lies in the fact that the Ambanis are not like other established dynasties. Dhirubhai Ambani started out as a lowly yarn trader, and through decades of hard work forged his empire. His sons still work $12-14$ hours a day, including weekends. Unlike many family firms, they have an experienced and long-serving team of professional mangers: over 100/0 have worked overseas, and half have worked outside the firm. Reliance pays well and, unusually for India, poaches from rival firms

In other words, Reliance has what it taken to be a world- class player. Yet ask the Ambanis about their ambitions and they do not once stray from their home turf, Mukesh Ambani talks grandly of his "endgame" of turning Reliance into an "Indian energy major". He has new ventures in telecommunications and power generation, and hopes to expand into roads, ports and other infrastructure, The only common thread, argues Manoj Badale of Monitor, an Amercan consultant who knows the firm well, is a focus on capital-intensive industries in which success turns on the ability to get round regulators—and that, it seems, is what the Ambanis reckon is Reliance's core competence.

D. the highly motivated work-force

cat1995 english-language passage-reading multiple-sub-parts

## 5.11.26 Multiple Sub Parts: CAT 1995 | Question: 126 top

Whatever philosophy may be, it is in the world and must relate to it. It breaks through the shell of the world in order to move

into the infinite. But it turns back in order to find in the finite its always unique historical foundation. It pushes into the furthest horizons beyond being-in-the-world in order to experience the present in the eternal. But even the profoundest meditation acquires its meaning by relating back to man's existence here and now. Philosophy glimpses the highest criteria, the starry heaven of the possible, and seeks in the light of the seemingly impossible the way o man's dignity in the phenomenon of his empirical existence. Philosophy addresses itself to individuals. It creates a free community of those who rely on each other in. their will for truth. Into this community the philosophic man would like to enter. It is there in the world at anytime, but cannot become a wordily institution without losing the freedom of its truth. He cannot know whether he belongs to it. No authority decides on his acceptance. He wants to live in his thinking in such a way as to make his acceptance possible. But how does the world relate to philosophy? There are chairs of philosophy at the universities. Nowadays they are an embarrassment. Philosophy is politely respected because of tradition, but despised in secret. The general opinion is: it has nothing of importance to say. Neither has it any practical value. It is named in public but does it really exist? Its existence is proved at least by the defense measures it provokes. We can see this from comments like: "Philosophy is too complicated. I don't understand it. It's beyond me. It's something for professionals. I have no gift for it. Therefore it doesn't concern me." But that is like saying: I don't need to bother about the fundamental questions of life: I can diligently bury myself in some special field of work or scholarship without thinking or questioning .its meaning, and, for the rest, have "opinions" and be content with that. The defense becomes fanatical. A benighted vital instinct hates philosophy. It is dangerous. If I understood it I-should have to change my life. I would find myself in another frame of mind, see everything in a different light, and have to judge anew. Better not think philosophically! Then come the accusers, who want to replace the obsolete philosophy by something new and totally different. It is mistrusted as the utterly mendacious end product of a bankrupt theology. The meaninglessness of philosophical propositions is made fun of. Philosophy is denounced as the willing handmaiden of political and other powers. For many politicians, their wretched trade would be easier if philosophy did not exist at all. Masses and functionaries are easier to manipulate when they do not think but only have a regimented intelligence. People must be prevented from becoming serious. Therefore it is better for philosophy to be boring. Let the chairs of philosophy rot. The more piffle is taught, the sooner people will be blinkered against the light of philosophy. Thus philosophy is
surrounded by enemies, most of whom are not conscious of being such. Bourgeois complacency, conventionality, the satisfactions of economic prosperity, the appreciation of science only for its technical achievements, the absolute will to power, the bonhomie of politicians, the fanaticism of ideologies, the literary self-assertiveness of talented writers - in all these things people parade their anti- philosophy. They do not notice it because they do not realize what they are doing. They are unaware that their anti- philosophy is itself a philosophy, but a perverted one, and that this anti-philosophy, if elucidated, would annihilate itself.

A suitable title for the passage would be:

A. Man and Philosophy
B. Philosophical angst
C. A Defence of Philosophy
D. The Enemies of Philosophy

cat1995 english-language passage-reading multiple-sub-parts

## 5.11.27 Multiple Sub Parts: CAT 1995 | Question: 127 top

Whatever philosophy may be, it is in the world and must relate to it. It breaks through the shell of the world in order to move into the infinite. But it turns back in order to find in the finite its always unique historical foundation. It pushes into the furthest horizons beyond being-in-the-world in order to experience the present in the eternal. But even the profoundest meditation acquires its meaning by relating back to man's existence here and now. Philosophy glimpses the highest criteria, the starry heaven of the possible, and seeks in the light of the seemingly impossible the way o man's dignity in the phenomenon of his empirical existence. Philosophy addresses itself to individuals. It creates a free community of those who rely on each other in. their will for truth. Into this community the philosophic man would like to enter. Answer key

## 5.11.28 Multiple Sub Parts: CAT 1995 | Question: 128 top

Whatever philosophy may be, it is in the world and must relate to it. It breaks through the shell of the world in order to move into the infinite. But it turns back in order to find in the finite its always unique historical foundation. It pushes into the furthest horizons beyond being-in-the-world in order to experience the present in the eternal. But even the profoundest meditation acquires its meaning by relating back to man's existence here and now. Philosophy glimpses the highest criteria, the starry heaven of the possible, and seeks in the light of the seemingly impossible the way o man's dignity in the phenomenon of his empirical existence. Philosophy addresses itself to individuals. It creates a free community of those who rely on each other in. their will for truth. Into this community the philosophic man would like to enter. It is there in the world at anytime, but cannot become a wordily institution without losing the freedom of its truth. He cannot know whether he belongs to it. No authority decides on his acceptance. He wants to live in his thinking in such a way as to make his acceptance possible. But how does the world relate to philosophy? There are chairs of philosophy at the universities. Nowadays they are an embarrassment. Philosophy is politely respected because of tradition, but despised in secret. The general opinion is: it has nothing of importance to say. Neither has it any practical value. It is named in public but does it really exist? Its existence is proved at least by the defense measures it provokes. We can see this from comments like: "Philosophy is too complicated. I don't understand it. It's beyond me. It's something for professionals. I have no gift for it. Therefore it doesn't concern me." But that is like saying: I don't need to bother about the fundamental questions of life: I can diligently bury myself in some special field of work or scholarship without thinking or questioning .its meaning, and, for the rest, have "opinions" and be content with that. The defense becomes fanatical. A benighted vital instinct hates philosophy. It is dangerous. If I understood it I-should have to change my life. I would find myself in another frame of mind, see everything in a different light, and have to judge anew. Better not think philosophically! Then come the accusers, who want to replace the obsolete philosophy by something new and totally different. It is mistrusted as the utterly mendacious end product of a bankrupt theology. The meaninglessness of philosophical propositions is made fun of. Philosophy is denounced as the willing handmaiden of political and other powers. For many politicians, their wretched trade would be easier if philosophy did not exist at all. Masses and functionaries are easier to manipulate when they do not think but only have a regimented intelligence. People must be prevented from becoming serious. Therefore it is better for philosophy to be boring. Let the chairs of philosophy rot. The more piffle is taught, the sooner people will be blinkered against the light of philosophy. Thus philosophy is
surrounded by enemies, most of whom are not conscious of being such. Bourgeois complacency, conventionality, the satisfactions of economic prosperity, the appreciation of science only for its technical achievements, the absolute will to power, the bonhomie of politicians, the fanaticism of ideologies, the literary self-assertiveness of talented writers - in all these things people parade their anti- philosophy. They do not notice it because they do not realize what they are doing. They are unaware that their anti- philosophy is itself a philosophy, but a perverted one, and that this anti-philosophy, if elucidated, would annihilate itself.

Which of the following is true, keeping the passage in mind?

A. Philosophy is evidently respected
B. Philosophy is secretly despised
C. Both (a) and (b)
D. Neither (a) nor (b)

cat1995 english-language passage-reading multiple-sub-parts

## 5.11.29 Multiple Sub Parts: CAT 1995 | Question: 129 top

Whatever philosophy may be, it is in the world and must relate to it. It breaks through the shell of the world in order to move into the infinite. But it turns back in order to find in the finite its always unique historical foundation. It pushes into the furthest horizons beyond being-in-the-world in order to experience the present in the eternal. But even the profoundest meditation acquires its meaning by relating back to man's existence here and now. Philosophy glimpses the highest criteria, the starry heaven of the possible, and seeks in the light of the seemingly impossible the way o man's dignity in the phenomenon of his

empirical existence. Philosophy addresses itself to individuals. It creates a free community of those who rely on each other in. their will for truth. Into this community the philosophic man would like to enter. It is there in the world at anytime, but cannot become a wordily institution without losing the freedom of its truth. He cannot know whether he belongs to it. No authority decides on his acceptance. He wants to live in his thinking in such a way as to make his acceptance possible. But how does the world relate to philosophy? There are chairs of philosophy at the universities. Nowadays they are an embarrassment. Philosophy is politely respected because of tradition, but despised in secret. The general opinion is: it has nothing of importance to say. Neither has it any practical value. It is named in public but does it really exist? Its existence is proved at least by the defense measures it provokes. We can see this from comments like: “Philosophy is too complicated. I don’t understand it. It’s beyond me. It’s something for professionals. I have no gift for it. Therefore it doesn’t concern me.” But that is like saying: I don’t need to bother about the fundamental questions of life: I can diligently bury myself in some special field of work or scholarship without thinking or questioning .its meaning, and, for the rest, have “opinions” and be content with that. The defense becomes fanatical. A benighted vital instinct hates philosophy. It is dangerous. If I understood it I-should have to change my life. I would find myself in another frame of mind, see everything in a different light, and have to judge anew. Better not think philosophically! Then come the accusers, who want to replace the obsolete philosophy by something new and totally different. It is mistrusted as the utterly mendacious end product of a bankrupt theology. The meaninglessness of philosophical propositions is made fun of. Philosophy is denounced as the willing handmaiden of political and other powers. For many politicians, their wretched trade would be easier if philosophy did not exist at all. Masses and functionaries are easier to manipulate when they do not think but only have a regimented intelligence. People must be prevented from becoming serious. Therefore it is better for philosophy to be boring. Let the chairs of philosophy rot. The more piffle is taught, the sooner people will be blinkered against the light of philosophy. Thus philosophy is
surrounded by enemies, most of whom are not conscious of being such. Bourgeois complacency, conventionality, the satisfactions of economic prosperity, the appreciation of science only for its technical achievements, the absolute will to power, the bonhomie of politicians, the fanaticism of ideologies, the literary self-assertiveness of talented writers - in all these things people parade their anti- philosophy. They do not notice it because they do not realize what they are doing. They are unaware that their anti- philosophy is itself a philosophy, but a perverted one, and that this anti-philosophy, if elucidated, would annihilate itself.

The word ‘chairs’, in the context of the passage, means:

A. wooden faced people
B. departments
C. separate chairs for philosophers
D. reserved seats for students of philosophy

## 5.11.30 Multiple Sub Parts: CAT 1995 | Question: 130 top

Whatever philosophy may be, it is in the world and must relate to it. It breaks through the shell of the world in order to move into the infinite. But it turns back in order to find in the finite its always unique historical foundation. It pushes into the furthest horizons beyond being-in-the-world in order to experience the present in the eternal. But even the profoundest meditation acquires its meaning by relating back to man’s existence here and now. Philosophy glimpses the highest criteria, the starry heaven of the possible, and seeks in the light of the seemingly impossible the way o man’s dignity in the phenomenon of his empirical existence. Philosophy addresses itself to individuals. It creates a free community of those who rely on each other in. their will for truth. Into this community the philosophic man would like to enter. It is there in the world at anytime, but cannot become a wordily institution without losing the freedom of its truth. He cannot know whether he belongs to it. No authority decides on his acceptance. He wants to live in his thinking in such a way as to make his acceptance possible. But how does the world relate to philosophy? There are chairs of philosophy at the universities. Nowadays they are an embarrassment. Philosophy is politely respected because of tradition, but despised in secret. The general opinion is: it has nothing of importance to say. Neither has it any practical value. It is named in public but does it really exist? Its existence is proved at least by the defense measures it provokes. We can see this from comments like: “Philosophy is too complicated. I don’t understand it. It’s beyond me. It’s something for professionals. I have no gift for it. Therefore it doesn’t concern me.” But that is like saying: I don’t need to bother about the fundamental questions of life: I can diligently bury myself in some special field of work or scholarship without thinking or questioning .its meaning, and, for the rest, have “opinions” and be content with that. The defense becomes fanatical. A benighted vital instinct hates philosophy. It is dangerous. If I understood it I-should have to change my life. I would find myself in another frame of mind, see everything in a different light, and have to judge anew. Better not think philosophically! Then come the accusers, who want to replace the obsolete philosophy by something new and totally different. It is mistrusted as the utterly mendacious end product of a bankrupt theology. The meaninglessness of philosophical propositions is made fun of. Philosophy is denounced as the willing handmaiden of political and other powers. For many politicians, their wretched trade would be easier if philosophy did not exist at all. Masses and functionaries are easier to manipulate when they do not think but only have a regimented intelligence. People must be prevented from becoming serious. Therefore it is better for philosophy to be boring. Let the chairs of philosophy rot. The more piffle is taught, the sooner people will be blinkered against the light of philosophy. Thus philosophy is
surrounded by enemies, most of whom are not conscious of being such. Bourgeois complacency, conventionality, the satisfactions of economic prosperity, the appreciation of science only for its technical achievements, the absolute will to power, the bonhomie of politicians, the fanaticism of ideologies, the literary self-assertiveness of talented writers - in all these things people parade their anti- philosophy. ## 5.11.31 Multiple Sub Parts: CAT 1995 | Question: 131 top

Whatever philosophy may be, it is in the world and must relate to it. It breaks through the shell of the world in order to move into the infinite. But it turns back in order to find in the finite its always unique historical foundation. It pushes into the furthest horizons beyond being-in-the-world in order to experience the present in the eternal. But even the profoundest meditation acquires its meaning by relating back to man's existence here and now. Philosophy glimpses the highest criteria, the starry heaven of the possible, and seeks in the light of the seemingly impossible the way o man's dignity in the phenomenon of his empirical existence. Philosophy addresses itself to individuals. It creates a free community of those who rely on each other in. their will for truth. Into this community the philosophic man would like to enter. It is there in the world at anytime, but cannot become a wordily institution without losing the freedom of its truth. He cannot know whether he belongs to it. No authority decides on his acceptance. He wants to live in his thinking in such a way as to make his acceptance possible. But how does the world relate to philosophy? There are chairs of philosophy at the universities. Nowadays they are an embarrassment. Philosophy is politely respected because of tradition, but despised in secret. The general opinion is: it has nothing of importance to say. Neither has it any practical value. It is named in public but does it really exist? Its existence is proved at least by the defense measures it provokes. We can see this from comments like: "Philosophy is too complicated. I don't understand it. It's beyond me. It's something for professionals. I have no gift for it. Therefore it doesn't concern me." But that is like saying: I don't need to bother about the fundamental questions of life: I can diligently bury myself in some special field of work or scholarship without thinking or questioning .its meaning, and, for the rest, have "opinions" and be content with that. The defense becomes fanatical. A benighted vital instinct hates philosophy. It is dangerous. If I understood it I-should have to change my life. I would find myself in another frame of mind, see everything in a different light, and have to judge anew. Better not think philosophically! Then come the accusers, who want to replace the obsolete philosophy by something new and totally different. It is mistrusted as the utterly mendacious end product of a bankrupt theology. The meaninglessness of philosophical propositions is made fun of. Philosophy is denounced as the willing handmaiden of political and other powers. For many politicians, their wretched trade would be easier if philosophy did not exist at all. Masses and functionaries are easier to manipulate when they do not think but only have a regimented intelligence. People must be prevented from becoming serious. Therefore it is better for philosophy to be boring. Let the chairs of philosophy rot. The more piffle is taught, the sooner people will be blinkered against the light of philosophy. Thus philosophy is
surrounded by enemies, most of whom are not conscious of being such. Bourgeois complacency, conventionality, the satisfactions of economic prosperity, the appreciation of science only for its technical achievements, the absolute will to power, the bonhomie of politicians, the fanaticism of ideologies, the literary self-assertiveness of talented writers - in all these things people parade their anti- philosophy. They do not notice it because they do not realize what they are doing. They are unaware that their anti- philosophy is itself a philosophy, but a perverted one, and that this anti-philosophy, if elucidated, would annihilate itself.

According to the author, the existence of philosophy is proved by:

A. the fact that there re still' chairs of philosophy in universities
B. the defense measures it provokes
C. the polite respect jt gets
D. the fact that it answers the fundamental questions of life.

## 5.11.32 Multiple Sub Parts: CAT 1995 | Question: 132 top

Whatever philosophy may be, it is in the world and must relate to it. It breaks through the shell of the world in order to move into the infinite. But it turns back in order to find in the finite its always unique historical foundation. It pushes into the furthest horizons beyond being-in-the-world in order to experience the present in the eternal. But even the profoundest meditation acquires its meaning by relating back to man's existence here and now. Philosophy glimpses the highest criteria, the starry heaven of the possible, and seeks in the light of the seemingly impossible the way o man's dignity in the phenomenon of his empirical existence. Philosophy addresses itself to individuals. It creates a free community of those who rely on each other in. their will for truth. Into this community the philosophic man would like to enter. It is there in the world at anytime, but cannot become a wordily institution without losing the freedom of its truth. He cannot know whether he belongs to it. No authority decides on his acceptance. He wants to live in his thinking in such a way as to make his acceptance possible. But how does the world relate to philosophy? There are chairs of philosophy at the universities. Nowadays they are an embarrassment. Philosophy is politely respected because of tradition, but despised in secret. The general opinion is: it has nothing of importance to say. Neither has it any practical value. It is named in public but does it really exist? Its existence is proved at

least by the defense measures it provokes. We can see this from comments like: “Philosophy is too complicated. I don’t understand it. It’s beyond me. It’s something for professionals. I have no gift for it. Therefore it doesn’t concern me.” But that is like saying: I don’t need to bother about the fundamental questions of life: I can diligently bury myself in some special field of work or scholarship without thinking or questioning .its meaning, and, for the rest, have “opinions” and be content with that. The defense becomes fanatical. A benighted vital instinct hates philosophy. It is dangerous. If I understood it I-should have to change my life. I would find myself in another frame of mind, see everything in a different light, and have to judge anew. Better not think philosophically! Then come the accusers, who want to replace the obsolete philosophy by something new and totally different. It is mistrusted as the utterly mendacious end product of a bankrupt theology. The meaninglessness of philosophical propositions is made fun of. Philosophy is denounced as the willing handmaiden of political and other powers. For many politicians, their wretched trade would be easier if philosophy did not exist at all. Masses and functionaries are easier to manipulate when they do not think but only have a regimented intelligence. People must be prevented from becoming serious. Therefore it is better for philosophy to be boring. Let the chairs of philosophy rot. The more piffle is taught, the sooner people will be blinkered against the light of philosophy. Thus philosophy is
surrounded by enemies, most of whom are not conscious of being such. Bourgeois complacency, conventionality, the satisfactions of economic prosperity, the appreciation of science only for its technical achievements, the absolute will to power, the bonhomie of politicians, the fanaticism of ideologies, the literary self-assertiveness of talented writers - in all these things people parade their anti- philosophy. They do not notice it because they do not realize what they are doing. They are unaware that their anti- philosophy is itself a philosophy, but a perverted one, and that this anti-philosophy, if elucidated, would annihilate itself.

Why, according to the passage, would politicians be happy if philosophy did not exist?

A. Masses would be easier to manipulate as they would not think for themselves.
B. They would not have to make false allegiances to ideologies.
C. They would not have to face allegations of ignoring philosophy.
D. They would not have to be philosophical about losing an election.

cat1995 english-language passage-reading multiple-sub-parts

## 5.11.33 Multiple Sub Parts: CAT 1995 | Question: 133 top

Among those who call themselves Socialists, two kinds of persons may be distinguished. There are, in the first place, those whose plans for a new order of society, in which private property and individual competition are to be superseded and other motives to action substituted, are on the scale of a village community or township, and would be applied to an entire country by the multiplication of such self-acting units; of this character are the systems of Owen, of Fourier, and the more thoughtful and philosophic Socialists generally. The other classes, who are more a product of the Continent than of Great Britain and may be called the revolutionary Socialists, propose to themselves a much bolder stroke. Their scheme is the management of the whole productive resources of the country by one central authority, the general government. And with this view some of them avow as their purpose that the working classes, or somebody on their behalf, should take possession of all the property of the country, and administer it for the general benefit.

Whatever be the difficulties of the first of these two forms of Socialism, the second must evidently involve the same difficulties and many more. The former, too, has the great advantage that it can be brought into operation progressively, and can prove its capabilities by trial. It can be tried first on a select population and extended to others as their education and cultivation permit. It need not, and in the natural order of things would not, become an engine of subversion until it had shown itself capable of being also a means of reconstruction. It is not so with the other: the aim of that is to substitute the new rule for the old at a single stroke, and to exchange the amount of goods realized under the present system, and its large possibilities of improvement, for a plunge without any preparation into the most extreme form of the problem of carrying on the whole round of the operations of social life without the motive power which has always hitherto worked the social machinery. ‘It must be acknowledged that those who would play this game on the strength of their own private opinion, unconfirmed as yet b’ any experimental verification - who would forcibly deprive all who have now a comfortable physical existence of their only present means of preserving it, and would brave the frightful bloodshed and misery that would ensue if the attempt was resisted - must have a serene confidence in their own wisdom on the one hand and a recklessness of other people's sufferings on the other, which Robespierre and St Just, hitherto the typical instances of those united attributes, scarcely came up to. Nevertheless, this scheme has great elements of popularity which the more cautious and reasonable form of Socialism has not: because what it professes to do, it promises to do quickly, and holds out hope to the enthusiastic of seeing the whole of their aspirations realized in their own time and at a blow.

According to the author, the difference between the two kinds of socialists is that:

A. one consists of thinkers and the others are active people.
B. the first have a definite philosophy and the second don’t have any definite philosophy.
C. the first believe in gradual change while the others believe in revolutionary change.
D. the first are the products of Britain, while the others are products of Russia.

## 5.11.40 Multiple Sub Parts: CAT 1995 | Question: 140 top

Among those who call themselves Socialists, two kinds of persons may be distinguished. There are, in the first place, those whose plans for a new order of society, in which private property and individual competition are to be superseded and other motives to action substituted, are on the scale of a village community or township, and would be applied to an entire country by the multiplication of such self-acting units; of this character are the systems of Owen, of Fourier, and the more thoughtful and philosophic Socialists generally. The other classes, who are more a product of the Continent than of Great Britain and may be called the revolutionary Socialists, propose to themselves a much bolder stroke. Their scheme is the management of the whole productive resources of the country by one central authority, the general government. And with this view some of them avow as their purpose that the working classes, or somebody on their behalf, should take possession of all the property of the country, and administer it for the general benefit.

Whatever be the difficulties of the first of these two forms of Socialism, the second must evidently involve the same difficulties and many more. The former, too, has the great advantage that it can be brought into operation progressively, and can prove its capabilities by trial. It can be tried first on a select population and extended to others as their education and cultivation permit. It need not, and in the natural order of things would not, become an engine of subversion until it had shown itself capable of being also a means of reconstruction. It is not so with the other: the aim of that is to substitute the new rule for the old at a single stroke, and to exchange the amount of goods realized under the present system, and its large possibilities of improvement, for a plunge without any preparation into the most extreme form of the problem of carrying on the whole round of the operations of social life without the motive power which has always hitherto worked the social machinery. ‘It must be acknowledged that those who would play this game on the strength of their own private opinion, unconfirmed as yet b’ any experimental verification - who would forcibly deprive all who have now a comfortable physical existence of their only present means of preserving it, and would brave the frightful bloodshed and misery that would ensue if the attempt was resisted - must have a serene confidence in their own wisdom on the one hand and a recklessness of other people's sufferings on the other, which Robespierre and St Just, hitherto the typical instances of those united attributes, scarcely came up to. Nevertheless, this scheme has great elements of popularity which the more cautious and reasonable form of Socialism has not: because what it professes to do, it promises to do quickly, and holds out hope to the enthusiastic of seeing the whole of their aspirations realized in their own time and at a blow.

Which of the following, according to the author, may not be the result of not verifying the desirability of socialism experimentally first?

A. bloodshed B. deprivation of current comfortable

existence

C. corruption in high places

D. misery caused by resisting change

## 5.11.41 Multiple Sub Parts: CAT 1995 | Question: 141 top

Experts in human behaviour argue that ethics and values are learned as a natural part of human development, derived from school, religion and other influences. Some authorities say that ethics is the innate notion of right and wrong and cannot be taught to an adult. This means that an individual has to have been shaped as honest and upstanding (or devious and venal) long before he or she sets foot in the corporate sector. Perhaps as a result of this belief, the corporate that form an integral part of a country's economy try to avoid dealing with the value based issues that they are confronted with on a day to day basis, unless forced to do so. Over time these practices become precedents and the fundamental value of dealing with ethics upfront loses its importance. After all, we have done it before and it has worked, so why not now?' is the general attitude. To the individual manager, value based conflicts tend to be largely personal, seldom corporate in nature or intensity. It turns corporate only when the espoused value is real and happening in the company. In performing these value based roles, managers are often trained to see its application on a commercial basis. Problems arise when the decisionmaker is unable to cope with commercial conflicts as differentiated from personal conflicts.

Part of being a good manager is being aware of the normal dimensions of one's role in the network and in the organisation. Managers can unwittingly engage in a wide range of role- related acts that are ethically questionable. A larger question before us is whether managers see this dissonance between what is perceived as unethical, and what is being practiced. For instance, a survey of HBR subscribers in 1981 revealed that the biggest issue is not defining sexual harassment but recognizing it when it occurs. Similarly, it was not until 1990 that the US government enacted the Americans with Disabilities Act that restricts employers from using medical tests to reveal a physical or mental impairment, except under special circumstances. Peter Drucker argues that business professionals are no different from other professionals, and should abide by the principle of nonmale-ficence. This involves studying the impact of acts on the good of the individual, the firm, the business community, and society as a whole. Crossing horizons of definitiveness is real in any pursuit of a meaningful debate on ethics. In fact it is essential for reaching a sense of conclusion, if possible. While it does not concentrate on the obligations of a person as a private individual and a citizen, these creep into the socio-economic system which governs business.

Laura Nash deals with twelve issues of ethics, addressing the basic question: "Is my business decision also an ethical decision?" Nash provides a framework that demonstrates the importance of critical thinking in business ethics where the goal is a corporate practice that does not foster unnecessary social harm. She emphasizes that her programme works in a concrete setting; that it is not utopian, philosophical abstraction. A person accepts certain special obligations when he/she becomes a part of the world of commerce. These obligations necessitate a reciprocal behavioral pattern in sync with individual values and beliefs viewed concurrently with those of the firm. Ethical congruence is the alignment of an organization's stated values, the decisions of its leaders, the behaviors that are encouraged by its systems and the values of its employees. The leader's responsibility is to give employees guidance as to what values employees are expected to demonstrate, in what priority and how absolute those priorities are.

Before a business can reach ethical congruence it must be clear on what it truly values. There must be a clear definition and articulation of values, beliefs, core philosophies, norms and ideals that the organisation chooses to follow, to practice in good times and bad, and to stand by under any circumstance. Once stated, agreed upon and articulated, this core operational and exceptional philosophy has to be tested for compatibility and acceptability with business vision, mission, core strategy and tactics, short and long term goals and objectives and expected behavioral outcomes.

It would be appropriate to comment here on the necessity for managerial courage. Donald F VanEynde defines it as "the willingness to do what is right in the face of risk". Risk here means a real or perceived danger to oneself, one's reputation or one's career; and includes such actions as confronting the status quo, embracing change in the face of resistance and opposing a popular but unhealthy idea. It means doing what is right, arid what needs to be done. The determining factors are the values and the power and position that the incumbent has, to do what he believes in. Ethics calls upon our courage to act upon what we believe in, and our willingness to sacrifice for the cause.

Managerial responsibilities and roles in the commercial field outline a broad range of activities, goals and standards created to sustain the performance of a business organisation. In performing roles not congruent with the traditional organisational practices, managers could engender ethical dissonance. There are primarily five role acts, (which may overlap), involved in ethical decision making in a commercial environment.

Self-enhanced ethical dilemma role acts are any acts that involve direct gains for the actor at the expense of the firm; they are managerial only in the sense that they take place in organisations and frequently involve those who happen, by title, to be called managers. Ethically questionable acts of this type, such as expense account cheating, insider trading, nexus with brokers and middlemen, embezzlement, receiving kickbacks from vendors, short changing petty cash accounts, transferring company information for a price, using/selling patents, formulations, new product development information and stealing supplies, are committed against the firm and in the self-interest of the individual. They are essentially unethical practices not in consonance

with the purpose of the firm.

The Indian financial services industry scam of the early 1990s, that unearthed the active involvement of individuals misusing their authority limits and conniving with brokers, is an example. Financiers have a fiduciary responsibility to be honest and to protect their clients' assets. At the corporate level there are several examples of inter corporate espionage. Just when Palm electronic organizer of 3Com, a runaway hit, was making huge headway, Microsoft decided to call handheld devices based on its Windows CE operating system Palm PCs. 3Com sued, claiming it owned the Palm name.

Myopic mania occurs in large and small role situations and is common among practicing managers. The behaviour is seldom random, is typically repetitive, has strong overtones of dominance and makes use of control and power. Role failure acts are directly related to managerial roles, and can be acts of commission or omission, such as superficial performance appraisals, not providing a fair and honorable feedback to employees on their performance and using leadership roles to enhance power through critical control over people.

Managers with myopic mania may hire and fire employees to show contempt towards process and system; they may not confront expense account cheating; may appease blackmailing employees to win personal favours against the company's interest; and may palm off a poor performer on to another department. At a heightened level of corruption they may systematically cheat the organisation intellectually Typically, such a manager would, at regular intervals, convey his desire to leave the current assignment for better carrier opportunity and seek a monetary/career favour in return for his loyalty. He would demonstrate his unhappiness at the current state of organisational performance and would show deep anguish over managerial inaction on unresolved problems. These managers have unrealistic selfperceptions and are often schizophrenic. Gullible top management is often taken in by their seemingly logical, rational approach. Deception is key to their unethical practice. These acts involve direct personal advantage (not necessarily financial gain) at the expense of the firm. A culture that fosters high performance driven job insecurity could make employees more susceptible to this ethical encounter.

The case of a large Indian business house that had to forcibly retire some of its top management and their consequent outburst to the media on the company could well mean this type of an ethical act.

Power is the potential to influence others for good or evil, to be a blessing or a scourge. Power pervades every aspect of life. Principle centered power, based on honour extended bilaterally, leads to influence that lasts over extended periods of time and can even outlive the person from whom it omanates.

In contrast, distortion, while appearing straight in its actions and motives, involves the use of power and authority, through goals. It also involves conduct that creates direct advantages for the firm in the short run while indirectly providing gains to the individual actors. This in turn displaces direct costs onto selected stakeholders outside and inside the organisation in the long run.

Power usage is evident in actions involving ethics. In some instances the stated positioning of the corporation makes it easy for elimination or avoidance of distortion. In other cases, the actions of a superior or a person with authority invariably appear right to the younger managers, who may actually believe that the decision was right and beneficial to the company. According to Jay Rohrlich, a psychiatrist, "Susceptible people will be seduced by that kind of magical power. Money is a magical commodity, in the sense that it does transform reality." Rohrlich also talks about a personality style that combines risk taking with. a grandiose sense of personal power. Such behaviour eventually leads to an organisational freeze status, given low visibility between what is right and what is not.

Bribery, price fixing and manipulation of supplies are some examples of managerial role distortion that benefit organisations in the short run. Cross holding patterns of shareholding are another example of this ethical issue. While capital is obtained for a stated purpose and cash flow generated, the surplus is often used up to lend to a sister company, often a losing proposition. In all such cases, it is necessary to attribute ethical ownership directly to the decision-maker.

The author is of the opinion that:

A. ethics and values are learned as a natural part of human development, derived from school, religion and other influences.
B. ethics is the innate notion of right and wrong and cannot be taught to an adult.
C. value based conflicts tend to be largely personal, seldom corporate in nature or intensity.
D. none of the above

## 5.11.44 Multiple Sub Parts: CAT 1995 | Question: 144 top

Experts in human behaviour argue that ethics and values are learned as a natural part of human development, derived from school, religion and other influences. Some authorities say that ethics is the innate notion of right and wrong and cannot be taught to an adult. This means that an individual has to have been shaped as honest and upstanding (or devious and venal) long before he or she sets foot in the corporate sector. Perhaps as a result of this belief, the corporate that form an integral part of a country's economy try to avoid dealing with the value based issues that they are confronted with on a day to day basis, unless forced to do so. Over time these practices become precedents and the fundamental value of dealing with ethics upfront loses its importance. After all, we have done it before and it has worked, so why not now?' is the general attitude. To the individual manager, value based conflicts tend to be largely personal, seldom corporate in nature or intensity. It turns corporate only when the espoused value is real and happening in the company. In performing these value based roles, managers are often trained to see its application on a commercial basis. Problems arise when the decisionmaker is unable to cope with commercial conflicts as differentiated from personal conflicts.

Part of being a good manager is being aware of the normal dimensions of one's role in the network and in the organisation. Managers can unwittingly engage in a wide range of role- related acts that are ethically questionable. A larger question before us is whether managers see this dissonance between what is perceived as unethical, and what is being practiced. For instance, a survey of HBR subscribers in 1981 revealed that the biggest issue is not defining sexual harassment but recognizing it when it occurs. Similarly, it was not until 1990 that the US government enacted the Americans with Disabilities Act that restricts employers from using medical tests to reveal a physical or mental impairment, except under special circumstances. Peter Drucker argues that business professionals are no different from other professionals, and should abide by the principle of nonmale-ficence. This involves studying the impact of acts on the good of the individual, the firm, the business community, and society as a whole. Crossing horizons of definitiveness is real in any pursuit of a meaningful debate on ethics. In fact it is essential for reaching a sense of conclusion, if possible. While it does not concentrate on the obligations of a person as a private individual and a citizen, these creep into the socio-economic system which governs business.

Laura Nash deals with twelve issues of ethics, addressing the basic question: "Is my business decision also an ethical decision?" Nash provides a framework that demonstrates the importance of critical thinking in business ethics where the goal is a corporate practice that does not foster unnecessary social harm. She emphasizes that her programme works in a concrete setting; that it is not utopian, philosophical abstraction. A person accepts certain special obligations when he/she becomes a part of the world of commerce. These obligations necessitate a reciprocal behavioral pattern in sync with individual values and beliefs viewed concurrently with those of the firm. Ethical congruence is the alignment of an organization's stated values, the decisions of its leaders, the behaviors that are encouraged by its systems and the values of its employees. The leader's responsibility is to give employees guidance as to what values employees are expected to demonstrate, in what priority and how absolute those priorities are.

Before a business can reach ethical congruence it must be clear on what it truly values. There must be a clear definition and articulation of values, beliefs, core philosophies, norms and ideals that the organisation chooses to follow, to practice in good times and bad, and to stand by under any circumstance. Once stated, agreed upon and articulated, this core operational and exceptional philosophy has to be tested for compatibility and acceptability with business vision, mission, core strategy and tactics, short and long term goals and objectives and expected behavioral outcomes.

It would be appropriate to comment here on the necessity for managerial courage. Donald F VanEynde defines it as "the willingness to do what is right in the face of risk". Risk here means a real or perceived danger to oneself, one's reputation or one's career; and includes such actions as confronting the status quo, embracing change in the face of resistance and opposing a popular but unhealthy idea. It means doing what is right, arid what needs to be done. The determining factors are the values and the power and position that the incumbent has, to do what he believes in. Ethics calls upon our courage to act upon what we believe in, and our willingness to sacrifice for the cause.

Managerial responsibilities and roles in the commercial field outline a broad range of activities, goals and standards created to sustain the performance of a business organisation. In performing roles not congruent with the traditional organisational practices, managers could engender ethical dissonance. There are primarily five role acts, (which may overlap), involved in ethical decision making in a commercial environment.

Self-enhanced ethical dilemma role acts are any acts that involve direct gains for the actor at the expense of the firm; they are managerial only in the sense that they take place in organisations and frequently involve those who happen, by title, to be called managers. Ethically questionable acts of this type, such as expense account cheating, insider trading, nexus with brokers and middlemen, embezzlement, receiving kickbacks from vendors, short changing petty cash accounts, transferring company information for a price, using/selling patents, formulations, new product development information and stealing supplies, are committed against the firm and in the self-interest of the individual. They are essentially unethical practices not in consonance with the purpose of the firm.

The Indian financial services industry scam of the early 1990s, that unearthed the active involvement of individuals misusing their authority limits and conniving with brokers, is an example. Financiers have a fiduciary responsibility to be honest and to protect their clients' assets. At the corporate level there are several examples of inter corporate espionage. Just when Palm electronic organizer of 3Com, a runaway hit, was making huge headway, Microsoft decided to call handheld devices based on its Windows CE operating system Palm PCs. 3Com sued, claiming it owned the Palm name.

Myopic mania occurs in large and small role situations and is common among practicing managers. The behaviour is seldom random, is typically repetitive, has strong overtones of dominance and makes use of control and power. Role failure acts are directly related to managerial roles, and can be acts of commission or omission, such as superficial performance appraisals, not providing a fair and honorable feedback to employees on their performance and using leadership roles to enhance power through critical control over people.

Managers with myopic mania may hire and fire employees to show contempt towards process and system; they may not confront expense account cheating; may appease blackmailing employees to win personal favours against the company's interest; and may palm off a poor performer on to another department. At a heightened level of corruption they may systematically cheat the organisation intellectually Typically, such a manager would, at regular intervals, convey his desire to leave the current assignment for better carrier opportunity and seek a monetary/career favour in return for his loyalty. He would demonstrate his unhappiness at the current state of organisational performance and would show deep anguish over managerial inaction on unresolved problems. These managers have unrealistic selfperceptions and are often schizophrenic. Gullible top management is often taken in by their seemingly logical, rational approach. Deception is key to their unethical practice. These acts involve direct personal advantage (not necessarily financial gain) at the expense of the firm. A culture that fosters high performance driven job insecurity could make employees more susceptible to this ethical encounter.

The case of a large Indian business house that had to forcibly retire some of its top management and their consequent outburst to the media on the company could well mean this type of an ethical act.

Power is the potential to influence others for good or evil, to be a blessing or a scourge. Power pervades every aspect of life. Principle centered power, based on honour extended bilaterally, leads to influence that lasts over extended periods of time and can even outlive the person from whom it omanates.

In contrast, distortion, while appearing straight in its actions and motives, involves the use of power and authority, through goals. It also involves conduct that creates direct advantages for the firm in the short run while indirectly providing gains to the individual actors. This in turn displaces direct costs onto selected stakeholders outside and inside the organisation in the long run.

Power usage is evident in actions involving ethics. In some instances the stated positioning of the corporation makes it easy for elimination or avoidance of distortion. In other cases, the actions of a superior or a person with authority invariably appear right to the younger managers, who may actually believe that the decision was right and beneficial to the company. According to Jay Rohrlich, a psychiatrist, "Susceptible people will be seduced by that kind of magical power. Money is a magical commodity, in the sense that it does transform reality." Rohrlich also talks about a personality style that combines risk taking with. a grandiose sense of personal power. Such behaviour eventually leads to an organisational freeze status, given low visibility between what is right and what is not.

Bribery, price fixing and manipulation of supplies are some examples of managerial role distortion that benefit organisations in the short run. Cross holding patterns of shareholding are another example of this ethical issue. While capital is obtained for a stated purpose and cash flow generated, the surplus is often used up to lend to a sister company, often a losing proposition. In all such cases, it is necessary to attribute ethical ownership directly to the decision-maker.

The example of Microsoft naming its hand.held devices as Palm PCs is given in the passage to highlight:

A. myopic mania
B. managerial courage
C. a point
D. an unethical practice

cat1995 english-language passage-reading multiple-sub-parts

## 5.11.45 Multiple Sub Parts: CAT 1995 | Question: 145 top

Experts in human behaviour argue that ethics and values are learned as a natural part of human development, derived from school, religion and other influences. Some authorities say that ethics is the innate notion of right and wrong and cannot be

taught to an adult. This means that an individual has to have been shaped as honest and upstanding (or devious and venal) long before he or she sets foot in the corporate sector. Perhaps as a result of this belief, the corporate that form an integral part of a country's economy try to avoid dealing with the value based issues that they are confronted with on a day to day basis, unless forced to do so. Over time these practices become precedents and the fundamental value of dealing with ethics upfront loses its importance. After all, we have done it before and it has worked, so why not now?' is the general attitude. To the individual manager, value based conflicts tend to be largely personal, seldom corporate in nature or intensity. It turns corporate only when the espoused value is real and happening in the company. In performing these value based roles, managers are often trained to see its application on a commercial basis. Problems arise when the decisionmaker is unable to cope with commercial conflicts as differentiated from personal conflicts.

Part of being a good manager is being aware of the normal dimensions of one's role in the network and in the organisation. Managers can unwittingly engage in a wide range of role- related acts that are ethically questionable. A larger question before us is whether managers see this dissonance between what is perceived as unethical, and what is being practiced. For instance, a survey of HBR subscribers in 1981 revealed that the biggest issue is not defining sexual harassment but recognizing it when it occurs. Similarly, it was not until 1990 that the US government enacted the Americans with Disabilities Act that restricts employers from using medical tests to reveal a physical or mental impairment, except under special circumstances. Peter Drucker argues that business professionals are no different from other professionals, and should abide by the principle of nonmale-ficence. This involves studying the impact of acts on the good of the individual, the firm, the business community, and society as a whole. Crossing horizons of definitiveness is real in any pursuit of a meaningful debate on ethics. In fact it is essential for reaching a sense of conclusion, if possible. While it does not concentrate on the obligations of a person as a private individual and a citizen, these creep into the socio-economic system which governs business.

Laura Nash deals with twelve issues of ethics, addressing the basic question: "Is my business decision also an ethical decision?" Nash provides a framework that demonstrates the importance of critical thinking in business ethics where the goal is a corporate practice that does not foster unnecessary social harm. She emphasizes that her programme works in a concrete setting; that it is not utopian, philosophical abstraction. A person accepts certain special obligations when he/she becomes a part of the world of commerce. These obligations necessitate a reciprocal behavioral pattern in sync with individual values and beliefs viewed concurrently with those of the firm. Ethical congruence is the alignment of an organization's stated values, the decisions of its leaders, the behaviors that are encouraged by its systems and the values of its employees. The leader's responsibility is to give employees guidance as to what values employees are expected to demonstrate, in what priority and how absolute those priorities are.

Before a business can reach ethical congruence it must be clear on what it truly values. There must be a clear definition and articulation of values, beliefs, core philosophies, norms and ideals that the organisation chooses to follow, to practice in good times and bad, and to stand by under any circumstance. Once stated, agreed upon and articulated, this core operational and exceptional philosophy has to be tested for compatibility and acceptability with business vision, mission, core strategy and tactics, short and long term goals and objectives and expected behavioral outcomes.

It would be appropriate to comment here on the necessity for managerial courage. Donald F VanEynde defines it as "the willingness to do what is right in the face of risk". Risk here means a real or perceived danger to oneself, one's reputation or one's career; and includes such actions as confronting the status quo, embracing change in the face of resistance and opposing a popular but unhealthy idea. It means doing what is right, arid what needs to be done. The determining factors are the values and the power and position that the incumbent has, to do what he believes in. Ethics calls upon our courage to act upon what we believe in, and our willingness to sacrifice for the cause.

Managerial responsibilities and roles in the commercial field outline a broad range of activities, goals and standards created to sustain the performance of a business organisation. In performing roles not congruent with the traditional organisational practices, managers could engender ethical dissonance. There are primarily five role acts, (which may overlap), involved in ethical decision making in a commercial environment.

These obligations necessitate a reciprocal behavioral pattern in sync with individual values and beliefs viewed concurrently with those of the firm. Ethical congruence is the alignment of an organization’s stated values, the decisions of its leaders, the behaviors that are encouraged by its systems and the values of its employees. The leader’s responsibility is to give employees guidance as to what values employees are expected to demonstrate, in what priority and how absolute those priorities are.

Before a business can reach ethical congruence it must be clear on what it truly values. There must be a clear definition and articulation of values, beliefs, core philosophies, norms and ideals that the organisation chooses to follow, to practice in good times and bad, and to stand by under any circumstance. Once stated, agreed upon and articulated, this core operational and exceptional philosophy has to be tested for compatibility and acceptability with business vision, mission, core strategy and tactics, short and long term goals and objectives and expected behavioral outcomes.

It would be appropriate to comment here on the necessity for managerial courage. Donald F VanEynde defines it as “the willingness to do what is right in the face of risk”. Risk here means a real or perceived danger to oneself, one’s reputation or one’s career; and includes such actions as confronting the status quo, embracing change in the face of resistance and opposing a popular but unhealthy idea. It means doing what is right, arid what needs to be done. The determining factors are the values and the power and position that the incumbent has, to do what he believes in. Ethics calls upon our courage to act upon what we believe in, and our willingness to sacrifice for the cause.

Managerial responsibilities and roles in the commercial field outline a broad range of activities, goals and standards created to sustain the performance of a business organisation. In performing roles not congruent with the traditional organisational practices, managers could engender ethical dissonance. There are primarily five role acts, (which may overlap), involved in ethical decision making in a commercial environment.

Self-enhanced ethical dilemma role acts are any acts that involve direct gains for the actor at the expense of the firm; they are managerial only in the sense that they take place in organisations and frequently involve those who happen, by title, to be called managers. Ethically questionable acts of this type, such as expense account cheating, insider trading, nexus with brokers and middlemen, embezzlement, receiving kickbacks from vendors, short changing petty cash accounts, transferring company information for a price, using/selling patents, formulations, new product development information and stealing supplies, are committed against the firm and in the self-interest of the individual. They are essentially unethical practices not in consonance with the purpose of the firm.

The Indian financial services industry scam of the early 1990s, that unearthed the active involvement of individuals misusing their authority limits and conniving with brokers, is an example. Financiers have a fiduciary responsibility to be honest and to protect their clients' assets. At the corporate level there are several examples of inter corporate espionage. Just when Palm electronic organizer of 3Com, a runaway hit, was making huge headway, Microsoft decided to call handheld devices based on its Windows CE operating system Palm PCs. 3Com sued, claiming it owned the Palm name.

Myopic mania occurs in large and small role situations and is common among practicing managers. The behaviour is seldom random, is typically repetitive, has strong overtones of dominance and makes use of control and power. Role failure acts are directly related to managerial roles, and can be acts of commission or omission, such as superficial performance appraisals, not providing a fair and honorable feedback to employees on their performance and using leadership roles to enhance power through critical control over people.

Managers with myopic mania may hire and fire employees to show contempt towards process and system; they may not confront expense account cheating; may appease blackmailing employees to win personal favours against the company's interest; and may palm off a poor performer on to another department. At a heightened level of corruption they may systematically cheat the organisation intellectually Typically, such a manager would, at regular intervals, convey his desire to leave the current assignment for better carrier opportunity and seek a monetary/career favour in return for his loyalty. He would demonstrate his unhappiness at the current state of organisational performance and would show deep anguish over managerial inaction on unresolved problems. These managers have unrealistic selfperceptions and are often schizophrenic. Gullible top management is often taken in by their seemingly logical, rational approach. Deception is key to their unethical practice. These acts involve direct personal advantage (not necessarily financial gain) at the expense of the firm. A culture that fosters high performance driven job insecurity could make employees more susceptible to this ethical encounter.

The case of a large Indian business house that had to forcibly retire some of its top management and their consequent outburst to the media on the company could well mean this type of an ethical act.

Power is the potential to influence others for good or evil, to be a blessing or a scourge. Power pervades every aspect of life. Principle centered power, based on honour extended bilaterally, leads to influence that lasts over extended periods of time and can even outlive the person from whom it omanates.

In contrast, distortion, while appearing straight in its actions and motives, involves the use of power and authority, through goals. It also involves conduct that creates direct advantages for the firm in the short run while indirectly providing gains to the individual actors. This in turn displaces direct costs onto selected stakeholders outside and inside the organisation in the long run.

Power usage is evident in actions involving ethics. In some instances the stated positioning of the corporation makes it easy for elimination or avoidance of distortion. In other cases, the actions of a superior or a person with authority invariably appear right to the younger managers, who may actually believe that the decision was right and beneficial to the company. According to Jay Rohrlich, a psychiatrist, "Susceptible people will be seduced by that kind of magical power. Money is a magical commodity, in the sense that it does transform reality." Rohrlich also talks about a personality style that combines risk taking with. a grandiose sense of personal power. Such behaviour eventually leads to an organisational freeze status, given low visibility between what is right and what is not.

Bribery, price fixing and manipulation of supplies are some examples of managerial role distortion that benefit organisations in the short run. Cross holding patterns of shareholding are another example of this ethical issue. While capital is obtained for a stated purpose and cash flow generated, the surplus is often used up to lend to a sister company, often a losing proposition. In all such cases, it is necessary to attribute ethical ownership directly to the decision-maker.

What is "managerial distortion" according to the author?

A. use of power and authority to create advantage for the firm as well as individuals in the short run while disguising costs
B. distorting the meaning of certain unethical practices so that they appear ethical
C. relying on distorted models of behaviour to deal with unethical behaviour
D. conveying wrong instructions to subordinates as the senior managers misuse their power and authority

cat1995 english-language passage-reading multiple-sub-parts

## 5.11.48 Multiple Sub Parts: CAT 1995 | Question: 148 top

Experts in human behaviour argue that ethics and values are learned as a natural part of human development, derived from school, religion and other influences. Problems arise when the decisionmaker is unable to cope with commercial conflicts as differentiated from personal conflicts.

Part of being a good manager is being aware of the normal dimensions of one's role in the network and in the organisation. Managers can unwittingly engage in a wide range of role- related acts that are ethically questionable. A larger question before us is whether managers see this dissonance between what is perceived as unethical, and what is being practiced. For instance, a survey of HBR subscribers in 1981 revealed that the biggest issue is not defining sexual harassment but recognizing it when it occurs. Similarly, it was not until 1990 that the US government enacted the Americans with Disabilities Act that restricts employers from using medical tests to reveal a physical or mental impairment, except under special circumstances. Peter Drucker argues that business professionals are no different from other professionals, and should abide by the principle of nonmale-ficence. This involves studying the impact of acts on the good of the individual, the firm, the business community, and society as a whole. Crossing horizons of definitiveness is real in any pursuit of a meaningful debate on ethics. In fact it is essential for reaching a sense of conclusion, if possible. While it does not concentrate on the obligations of a person as a private individual and a citizen, these creep into the socio-economic system which governs business.

Laura Nash deals with twelve issues of ethics, addressing the basic question: "Is my business decision also an ethical decision?" Nash provides a framework that demonstrates the importance of critical thinking in business ethics where the goal is a corporate practice that does not foster unnecessary social harm. She emphasizes that her programme works in a concrete setting; that it is not utopian, philosophical abstraction. A person accepts certain special obligations when he/she becomes a part of the world of commerce. These obligations necessitate a reciprocal behavioral pattern in sync with individual values and beliefs viewed concurrently with those of the firm. Ethical congruence is the alignment of an organization's stated values, the decisions of its leaders, the behaviors that are encouraged by its systems and the values of its employees. The leader's responsibility is to give employees guidance as to what values employees are expected to demonstrate, in what priority and how absolute those priorities are.

Before a business can reach ethical congruence it must be clear on what it truly values. There must be a clear definition and articulation of values, beliefs, core philosophies, norms and ideals that the organisation chooses to follow, to practice in good times and bad, and to stand by under any circumstance. Once stated, agreed upon and articulated, this core operational and exceptional philosophy has to be tested for compatibility and acceptability with business vision, mission, core strategy and tactics, short and long term goals and objectives and expected behavioral outcomes.

It would be appropriate to comment here on the necessity for managerial courage. Donald F VanEynde defines it as "the willingness to do what is right in the face of risk". Risk here means a real or perceived danger to oneself, one's reputation or one's career; and includes such actions as confronting the status quo, embracing change in the face of resistance and opposing a popular but unhealthy idea. It means doing what is right, arid what needs to be done. The determining factors are the values and the power and position that the incumbent has, to do what he believes in. Ethics calls upon our courage to act upon what we believe in, and our willingness to sacrifice for the cause.

Managerial responsibilities and roles in the commercial field outline a broad range of activities, goals and standards created to sustain the performance of a business organisation. In performing roles not congruent with the traditional organisational practices, managers could engender ethical dissonance. There are primarily five role acts, (which may overlap), involved in ethical decision making in a commercial environment.

Self-enhanced ethical dilemma role acts are any acts that involve direct gains for the actor at the expense of the firm; they are managerial only in the sense that they take place in organisations and frequently involve those who happen, by title, to be called managers. Ethically questionable acts of this type, such as expense account cheating, insider trading, nexus with brokers and middlemen, embezzlement, receiving kickbacks from vendors, short changing petty cash accounts, transferring company information for a price, using/selling patents, formulations, new product development information and stealing supplies, are committed against the firm and in the self-interest of the individual. They are essentially unethical practices not in consonance with the purpose of the firm.

The Indian financial services industry scam of the early 1990s, that unearthed the active involvement of individuals misusing their authority limits and conniving with brokers, is an example. Financiers have a fiduciary responsibility to be honest and to protect their clients' assets. At the corporate level there are several examples of inter corporate espionage. Just when Palm electronic organizer of 3Com, a runaway hit, was making huge headway, Microsoft decided to call handheld devices based on its Windows CE operating system Palm PCs. 3Com sued, claiming it owned the Palm name.

Myopic mania occurs in large and small role situations and is common among practicing managers. The behaviour is seldom random, is typically repetitive, has strong overtones of dominance and makes use of control and power. Role failure acts are

directly related to managerial roles, and can be acts of commission or omission, such as superficial performance appraisals, not providing a fair and honorable feedback to employees on their performance and using leadership roles to enhance power through critical control over people.

Managers with myopic mania may hire and fire employees to show contempt towards process and system; they may not confront expense account cheating; may appease blackmailing employees to win personal favours against the company's interest; and may palm off a poor performer on to another department. At a heightened level of corruption they may systematically cheat the organisation intellectually Typically, such a manager would, at regular intervals, convey his desire to leave the current assignment for better carrier opportunity and seek a monetary/career favour in return for his loyalty. He would demonstrate his unhappiness at the current state of organisational performance and would show deep anguish over managerial inaction on unresolved problems. These managers have unrealistic selfperceptions and are often schizophrenic. Gullible top management is often taken in by their seemingly logical, rational approach. Deception is key to their unethical practice. These acts involve direct personal advantage (not necessarily financial gain) at the expense of the firm. A culture that fosters high performance driven job insecurity could make employees more susceptible to this ethical encounter.

The case of a large Indian business house that had to forcibly retire some of its top management and their consequent outburst to the media on the company could well mean this type of an ethical act.

Power is the potential to influence others for good or evil, to be a blessing or a scourge. Power pervades every aspect of life. Principle centered power, based on honour extended bilaterally, leads to influence that lasts over extended periods of time and can even outlive the person from whom it omanates.

In contrast, distortion, while appearing straight in its actions and motives, involves the use of power and authority, through goals. It also involves conduct that creates direct advantages for the firm in the short run while indirectly providing gains to the individual actors. This in turn displaces direct costs onto selected stakeholders outside and inside the organisation in the long run.

Power usage is evident in actions involving ethics. In some instances the stated positioning of the corporation makes it easy for elimination or avoidance of distortion. In other cases, the actions of a superior or a person with authority invariably appear right to the younger managers, who may actually believe that the decision was right and beneficial to the company. According to Jay Rohrlich, a psychiatrist, "Susceptible people will be seduced by that kind of magical power. Money is a magical commodity, in the sense that it does transform reality." Rohrlich also talks about a personality style that combines risk taking with. a grandiose sense of personal power. Such behaviour eventually leads to an organisational freeze status, given low visibility between what is right and what is not.

Bribery, price fixing and manipulation of supplies are some examples of managerial role distortion that benefit organisations in the short run. Cross holding patterns of shareholding are another example of this ethical issue. While capital is obtained for a stated purpose and cash flow generated, the surplus is often used up to lend to a sister company, often a losing proposition. In all such cases, it is necessary to attribute ethical ownership directly to the decision-maker.

Which of the following statements is true in the context of the passage?

A. business and managers should largely act ethically
B. acting unethically is harmful to the business in the long run
C. being ethical is largely a matter of the individual, not of the corporate
D. none of these

## 5.11.49 Multiple Sub Parts: CAT 1995 | Question: 149 top

Experts in human behaviour argue that ethics and values are learned as a natural part of human development, derived from school, religion and other influences. Some authorities say that ethics is the innate notion of right and wrong and cannot be taught to an adult. This means that an individual has to have been shaped as honest and upstanding (or devious and venal) long before he or she sets foot in the corporate sector. Perhaps as a result of this belief, the corporate that form an integral part of a country's economy try to avoid dealing with the value based issues that they are confronted with on a day to day basis, unless forced to do so. Over time these practices become precedents and the fundamental value of dealing with ethics upfront loses its importance. After all, we have done it before and it has worked, so why not now?' is the general attitude. To the individual manager, value based conflicts tend to be largely personal, seldom corporate in nature or intensity. It turns corporate only when the espoused value is real and happening in the company. In performing these value based roles, managers are often trained to see its application on a commercial basis. Problems arise when the decisionmaker is unable to cope with commercial conflicts as differentiated from personal conflicts.

Part of being a good manager is being aware of the normal dimensions of one's role in the network and in the organisation. Managers can unwittingly engage in a wide range of role- related acts that are ethically questionable. A larger question before us is whether managers see this dissonance between what is perceived as unethical, and what is being practiced. Which of the following is a result of myopic mania?

A. short sightedness of the manager
B. inability to deal with long term strategy

C. contempt towards the process and systems
D. a logical, rational approach which does not gel with the company

cat1995 english-language passage-reading multiple-sub-parts

## 5.12 Numerical Answer (5) top

### 5.12.1 Numerical Answer: CAT 2019 Set-1 | Question: 25 top

Scientists recently discovered that Emperor Penguins-one of Antarctica's most celebrated species-employ a particularly unusual technique for surviving the daily chill. As detailed in an article published today in the journal Biology Letters, the birds minimize heat loss by keeping the outer surface of their plumage below the temperature of the surrounding air. At the same time, the penguins' thick plumage insulates their body and keeps it toasty…

The researchers analyzed thermographic images… taken over roughly a month during June 2008. During that period, the average air temperature was 0.32 degrees Fahrenheit. At the same time, the majority of the plumage covering the penguin's bodies was even colder: the surface of their warmest body part, their feet, was an average 1.76 degrees Fahrenheit, but the plumage on their heads, chests and backs were−1.84, − 7.24 and −9.76 degrees Fahrenheit respectively. Overall, nearly the entire outer surface of the penguin's bodies was below freezing at all times, except for their eyes and beaks. The scientists also used a computer simulation to determine how much heat was lost or gained from each part of the body-and discovered that by keeping their outer surface below air temperature, the birds might paradoxically be able to draw very slight amounts of heat from the air around them. The key to their trick is the difference between two different types of heat transfer: radiation and convection.

The penguins do lose internal body heat to the surrounding air through thermal radiation, just as our bodies do on a cold day. Because their bodies(but not surface plumage) are warmer than the surrounding air, heat gradually radiates outward over time, moving from warmer material to a colder one. To maintain body temperature while losing heat, penguins, like all warm-blooded animals, rely on the metabolism of food. The penguins, though, have an additional strategy. Since their outer plumage is even colder than the air, the simulation showed that they might gain back a little of this heat through thermal convection-the transfer of heat via the movement of a fluid (in this case, the air). As the cold Antarctic air cycles around their bodies slightly warmer air comes into contact with the plumage and donates minute amounts of heat back to the penguins, then cycles away at a slightly colder temperature.

Most of this heat, the researches note, probably doesn't make it all the way through the plumage and back to the penguin's bodies, but it could make a slight difference. At the very least, the method by which a penguin's plumage wicks heat from the bitterly cold air that surrounds it helps to cancel out some of the heat that's radiating from its interior. And given the Emperor's unusually demanding breeding cycle, every bit of warmth counts… Since [penguins trek as far as 75 miles to the coast to breed and male penguins] don't eat anything during[the incubation period of 64 days], conserving calories by giving up as little heat as possible is absolutely crucial.

The four sentences (labelled 1, 2, 3, 4) given below, when properly sequenced would yield a coherent paragraph. Decide on the proper sequence of the order of the sentences and key in the sequence of the four numbers as your answer.

1. People with dyslexia have difficulty with print-reading, and people with autism spectrum disorder have difficulty with mind-reading
2. An example of a lost cognitive instinct is mind-reading: our capacity to think of ourselves and others as having beliefs, desires, thoughts and feelings
3. Mind-reading looks increasingly like literacy, a skill we know for sure is not in our genes, since scripts have been around for only 5,000-6,000 years
4. Print-reading, like mind-reading varies across cultures, depends heavily on certain parts of the brain, and is subject to developmental disorders

cat2019-1 verbal-ability passage-reading numerical-answer

### 5.12.2 Numerical Answer: CAT 2019 Set-1 | Question: 26 top

Scientists recently discovered that Emperor Penguins-one of Antarctica's most celebrated species-employ a particularly unusual technique for surviving the daily chill. ### 5.12.3 Numerical Answer: CAT 2019 Set-1 | Question: 27 top

Scientists recently discovered that Emperor Penguins-one of Antarctica's most celebrated species-employ a particularly unusual technique for surviving the daily chill. As detailed in an article published today in the journal Biology Letters, the birds minimize heat loss by keeping the outer surface of their plumage below the temperature of the surrounding air. At the same time, the penguins' thick plumage insulates their body and keeps it toasty…

The researchers analyzed thermographic images… taken over roughly a month during June 2008. During that period, the average air temperature was 0.32 degrees Fahrenheit. At the same time, the majority of the plumage covering the penguin's bodies was even colder: the surface of their warmest body part, their feet, was an average 1.76 degrees Fahrenheit, but the plumage on their heads, chests and backs were $-1.84$, $-7.24$ and $-9.76$ degrees Fahrenheit respectively. Overall, nearly the entire outer surface of the penguin's bodies was below freezing at all times, except for their eyes and beaks. The scientists also used a computer simulation to determine how much heat was lost or gained from each part of the body-and discovered that by keeping their outer surface below air temperature, the birds might paradoxically be able to draw very slight amounts of heat from the air around them. The key to their trick is the difference between two different types of heat transfer: radiation and convection.

The penguins do lose internal body heat to the surrounding air through thermal radiation, just as our bodies do on a cold day. Because their bodies(but not surface plumage) are warmer than the surrounding air, heat gradually radiates outward over time, moving from warmer material to a colder one. To maintain body temperature while losing heat, penguins, like all warm-blooded animals, rely on the metabolism of food. The penguins, though, have an additional strategy. Since their outer plumage is even colder than the air, the simulation showed that they might gain back a little of this heat through thermal convection-the transfer of heat via the movement of a fluid (in this case, the air). As the cold Antarctic air cycles around their bodies slightly warmer air comes into contact with the plumage and donates minute amounts of heat back to the penguins, then cycles away at a slightly colder temperature.

Most of this heat, the researches note, probably doesn't make it all the way through the plumage and back to the penguin's bodies, but it could make a slight difference. At the very least, the method by which a penguin's plumage wicks heat from the bitterly cold air that surrounds it helps to cancel out some of the heat that's radiating from its interior. And given the Emperor's unusually demanding breeding cycle, every bit of warmth counts… Since [penguins trek as far as 75 miles to the coast to breed and male penguins] don't eat anything during[the incubation period of 64 days], conserving calories by giving up as little heat as possible is absolutely crucial.

Five sentences related to a topic are given below. Four of them can be put together to form a meaningful and coherent short paragraph. Identify the odd one out. Choose its number as your answer and key it in.

1. One argument is that actors that do not fit within a single, well-defined category may suffer an “illegitimacy discount”
2. Others believe that complex identities confuse audiences about an organization’s role or purpose
3. Some organizations have complex and multidimensional identities that span or combine categories, while other organizations possess narrow identities
4. Identity is one of the most important features of organizations, but there exist opposing views among sociologists about how identity affects organizational performance
5. Those who think that complex identities are beneficial point to the strategic advantages of ambiguity, and organizations’ potential to differentiate themselves from competitors.

## 5.12.4 Numerical Answer: CAT 2019 Set-1 | Question: 28 top

Scientists recently discovered that Emperor Penguins-one of Antarctica’s most celebrated species-employ a particularly unusual technique for surviving the daily chill. As detailed in an article published today in the journal Biology Letters, the birds minimize heat loss by keeping the outer surface of their plumage below the temperature of the surrounding air. At the same time, the penguins’ thick plumage insulates their body and keeps it toasty…

The researchers analyzed thermographic images… taken over roughly a month during June 2008. During that period, the average air temperature was 0.32 degrees Fahrenheit. At the same time, the majority of the plumage covering the penguin’s bodies was even colder: the surface of their warmest body part, their feet, was an average 1.76 degrees Fahrenheit, but the plumage on their heads, chests and backs were $-1.84$, $-7.24$ and $-9.76$ degrees Fahrenheit respectively. Overall, nearly the entire outer surface of the penguin’s bodies was below freezing at all times, except for their eyes and beaks. The scientists also used a computer simulation to determine how much heat was lost or gained from each part of the body-and discovered that by keeping their outer surface below air temperature, the birds might paradoxically be able to draw very slight amounts of heat from the air around them. The key to their trick is the difference between two different types of heat transfer: radiation and convection.

The penguins do lose internal body heat to the surrounding air through thermal radiation, just as our bodies do on a cold day. Because their bodies(but not surface plumage) are warmer than the surrounding air, heat gradually radiates outward over time, moving from warmer material to a colder one. To maintain body temperature while losing heat, penguins, like all warm-blooded animals, rely on the metabolism of food. The penguins, though, have an additional strategy. Since their outer plumage is even colder than the air, the simulation showed that they might gain back a little of this heat through thermal convection-the transfer of heat via the movement of a fluid (in this case, the air). As the cold Antarctic air cycles around their bodies slightly warmer air comes into contact with the plumage and donates minute amounts of heat back to the penguins, then cycles away at a slightly colder temperature.

Most of this heat, the researches note, probably doesn't make it all the way through the plumage and back to the penguin’s bodies, but it could make a slight difference. At the very least, the method by which a penguin's plumage wicks heat from the bitterly cold air that surrounds it helps to cancel out some of the heat that's radiating from its interior. And given the Emperor's unusually demanding breeding cycle, every bit of warmth counts… Since [penguins trek as far as 75 miles to the coast to breed and male penguins] don't eat anything during[the incubation period of 64 days], conserving calories by giving up as little heat as possible is absolutely crucial.

The four sentences (labelled 1, 2, 3, 4) given below, when properly sequenced would yield a coherent paragraph. Decide on the proper sequence of the order of the sentences and key in the sequence of the four numbers as your answer.

1. If you’ve seen a little line of text on websites that says something like "customers who bought this also enjoyed that” you have experienced this collaborative filtering firsthand
2. The problem with these algorithms is that they don’t take into account a host of nuances and circumstances that might interfere with their accuracy
3. If you just bought a gardening book for your cousin, you might get a flurry of links to books about gardening, recommended just for you! – the algorithm has no way of knowing you hate gardening and only bought the book as a gift
4. Collaborative filtering is a mathematical algorithm by which correlations and cooccurrences of behaviors are tracked and then used to make recommendations

### 5.13.3 Odd One Out: CAT 1995 | Question: 9 top

Pick the odd man out.

A. sporadic B. frequent C. intermittent D. scarce

cat1995 english-language odd-one-out

Answer key

### 5.13.4 Odd One Out: CAT 2011 | Question: 33 top

In the given question, all the sentences except one sentence,when properly sequenced form a coherent paragraph. Each sentence is labeled with a letter. Choose the sentence which does not form a part of the paragraph from among the four given choices.

A. The revolution called Human Relations is quieter but more profound and is sweeping through U.S industry.

B. Gradually, men felt themselves swallowed by a vast, impersonal machine, which rubbed away their self-respect and in a way their identiti

C. In anger against betrayal of the human spirit by the Industrial Revolution, million of workers listened to the false promises of Marx's philosophy.

D. The Industrial Revolution, replaced the tools of the independent workmen with machines, had transformed handicraftsmen who were their own bosses into hired hands subject to the orders of managers.

a. A

b. B

c. C

d. D

cat2011 verbal-ability odd-one-out

### 5.13.5 Odd One Out: CAT 2017 Set-1 | Question: 32 top

Find the odd sentence out from the given sentences:

1. People who study children's language spend a lot of time watching how babies react to speech they hear around them.
2. They make films of adults and babies interacting, and examine them very carefully to see whether the babies show any signs of understanding what the adults say.
3. They believe that babies begin to react to language from the very moment they are born.
4. Sometimes the signs are very subtle – slight movements of the baby's eyes or the head or the hands.
5. You'd never notice them if you were just sitting with the child, but by watching a recording over and over, you can spot them.

A. 2 B. 3 C. 4 D. 1

cat2017-1 verbal-ability odd-one-out

### 5.13.6 Odd One Out: CAT 2017 Set-1 | Question: 33 top

Find the odd sentence out of the below given sentences:

1. Neuroscientists have just begun studying exercise's impact within brain cells-on the genes themselves.
2. Even there, in the roots of our biology, they've found signs of the body's influence on the mind.
3. It turns out that moving our muscles produces proteins that travel through the bloodstream and into the brain, where they play pivotal roles in the mechanisms of our highest thought processes.
4. In today's technology-driven, plasma-screened-in world, it's easy to forget that we are born movers – animals, in fact – because we've engineered movement right out of our lives.
5. It's only in the past few years that neuroscientists have begun to describe these factors and how they work, and each new discovery adds awe-inspiring depth to the picture

A. 4 B. 3 C. 2 D. 5

cat2017-1 verbal-ability odd-one-out

### 5.13.7 Odd One Out: CAT 2017 Set-1 | Question: 34 top

Find the odd sentence out from the below sentences:

1. The water that made up ancient lakes and perhaps an ocean was lost.
2. Particles from the Sun collided with molecules in the atmosphere, knocking them into space or giving them an electric charge that caused them to be swept away by the solar wind.
3. Most of the planet's remaining water is now frozen or buried, but clues over the past decade suggested that some liquid water, a presumed necessity for life, might survive in underground aquifers.

4. Data from NASA'S MAVEN orbiter show that solar storms stripped away most of Mars's once-thick atmosphere.
5. A recent study reveals how Mars lost much of its early water, while another indicates that some liquid water remains

A. 3 B. 4 C. 5 D. 1

cat2017-1 verbal-ability odd-one-out

### 5.13.8 Odd One Out: CAT 2017 Set-2 | Question: 32 top

Odd One Out:

1. Although we are born with the gift of language, research shows that we are surprisingly unskilled when it comes to communicating with others.
2. We must carefully orchestrate our speech if we want to achieve our goals and bring our dreams to fruition.
3. We often choose our words without thought, oblivious of the emotional effects they can have on others.
4. We talk more than we need to, ignoring the effect we are having on those listening to us.
5. We listen poorly, without realizing it, and we often fail to pay attention to the subtle meanings conveyed by facial expressions, body gestures, and the tone and cadence of our voice.

A. 2 B. 1 C. 3 D. 5

cat2017-2 verbal-ability odd-one-out

### 5.13.9 Odd One Out: CAT 2017 Set-2 | Question: 33 top

Find the odd one out:

1. Over the past fortnight, one of its finest champions managed to pull off a similar impression.
2. Wimbledon's greatest illusion is the sense of timelessness it evokes.
3. At 35 years and 342 days, Roger Federer became the oldest man to win the singles title in the Open Era – a full 14 years after he first claimed the title as a scruffy, pony-tailed upstart.
4. Once he had survived the opening week, the second week witnessed the range of a rested Federer's genius.
5. Given that his method isn't reliant on explosive athleticism or muscular ball-striking, both vulnerable to decay, there is cause to believe that Federer will continue to enchant for a while longer.

A. 3 B. 4 C. 5 D. 1

cat2017-2 verbal-ability odd-one-out

### 5.13.10 Odd One Out: CAT 2017 Set-2 | Question: 34 top

**Find the odd one out:**

1. Those geometric symbols and aerodynamic swooshes are more than just skin deep.
2. The Commonwealth Bank logo – a yellow diamond, with a black chunk sliced out in one corner – is so recognisable that the bank doesn't even use its full name in its advertising.
3. It's not just logos with hidden shapes; sometimes brands will have meanings or stories within them that are deliberately vague or lost in time, urging you to delve deeper to solve the riddle.
4. Graphic designers embed cryptic references because it adds a story to the brand; they want people to spend more time with a brand and have that idea that they are an insider if they can understand the hidden message.
5. But the CommBank logo has more to it than meets the eye, as squirrelled away in that diamond is the Southern Cross constellation.

A. 2 B. 3 C. 1 D. 4

cat2017-2 verbal-ability odd-one-out

### 5.13.11 Odd One Out: CAT 2018 Set-1 | Question: 32 top

Five sentences related to a topic are given below. Four of them can be put together to form a meaningful and coherent short paragraph. Identify the odd one out.

1. In many cases time inconsistency is what prevents our going from intention to action.
2. For people to continuously postpone getting their children immunized, they would need to be constantly fooled by themselves.
3. In the specific case of immunization, however, it is hard to believe that time inconsistency by itself would be sufficient to make people permanently postpone the decision if they were fully cognizant of its benefits.

4. In most cases, even a small cost of immunization was large enough to discourage most people.
5. Not only do they have to think that they prefer to spend time going to the camp next month rather than today, they also have to believe that they will indeed go next month.

cat2018-1 verbal-ability odd-one-out numerical-answer

### 5.13.12 Odd One Out: CAT 2018 Set-1 | Question: 33 top

Five sentences related to a topic are given below. Four of them can be put together to form a meaningful and coherent short paragraph. Identify the odd one out.

1. Displacement in Bengal is thus not very significant in view of its magnitude.
2. A factor of displacement in Bengal is the shifting course of the Ganges leading to erosion of river banks.
3. The nature of displacement in Bengal makes it an interesting case study.
4. Since displacement due to erosion is well spread over a long period of time, it remains invisible.
5. Rapid displacement would have helped senitize the public to its human costs.

cat2018-1 verbal-ability odd-one-out numerical-answer

### 5.13.13 Odd One Out: CAT 2018 Set-2 | Question: 25 top

Five sentences related to a topic are given below. Four of them can be put together to form a meaningful and coherent short paragraph. Identify the odd one out.

A. Much has been recently discovered about the development of songs in birds
B. Some species are restricted to a single song learned by all individuals, others have a range of songs
C. The most important auditory stimuli for the birds are the sounds of other birds
D. For all bird species there is a prescribed path to development of the final song

### 5.13.14 Odd One Out: CAT 2018 Set-2 | Question: 29 top

Five sentences related to a topic are given below. Four of them can be put together to form a meaningful and coherent short paragraph. Identify the odd one out.

A. As India looks to increase the number of cities, our urban planning must factor in potential natural disasters and work out contingencies in advance
B. Authorities must revise data and upgrade infrastructure and mitigation plans even if their local area hasn't been visited by a natural calamity yet
C. Extreme temperatures, droughts, and forest fires have more than doubled since 1980
D. There is no denying the fact that our baseline normal weather is changing

cat2018-2 verbal-ability odd-one-out

### 5.13.15 Odd One Out: CAT 2018 Set-2 | Question: 33 top

Five sentences related to a topic are given below. Four of them can be put together to form a meaningful and coherent short paragraph. ldentify the odd one out. Choose its number as your answer and key the number in:

A. Our smartphones can now track our diets, our biological cycles, even our digestive systems and sleep-patterns
B. Researchers have even coined a new term, "orthosomnia", to describe the insomnia brought on by paying too much attention to smartphones and sleep-tracking apps
C. Sleep, nature's soft nurse, is a blissful, untroubled state all too easily disturbed by earthly worries or a guilty conscience
D. The existence of a market for such apps is unsurprising: shift work, a long-hours culture and blue light from screens have conspired to rob many of us of sufficient rest

cat2018-2 verbal-ability odd-one-out

### 5.13.16 Odd One Out: CAT 2019 Set-2 | Question: 26 top

Five sentences related to a topic are given below in a jumbled order. Four of them form a coherent and unified paragraph. Identify the odd sentence that does not go with the four. Key in the number of the option that you choose.

A. Socrates told us that ‘the unexamined life is not worth living’ and that to ‘know thyself’ is the path to true wisdom
B. It suggests that you should adopt an ancient rhetorical method favored by the likes of Julius Caesar and known as ‘illeism’ – or speaking about yourself in the third person
C. Research has shown that people who are prone to rumination also often suffer from impaired decision making under pressure and are at a substantially increased risk of depression
D. Simple rumination – the process of churning your concerns around in your head – is not the way to achieve self-realization
E. The idea is that this small change in perspective can clear your emotional fog, allowing you to see past your biases

### 5.13.18 Odd One Out: CAT 2019 Set-2 | Question: 31 top

Five sentences related to a topic are given below. Four of them can be put together to form a meaningful and coherent short paragraph. Identify the odd one out. Choose its number as your answer and key it in.

A. Ocean plastic is problematic for a number of reasons, but primarily because marine animals eat it
B. The largest numerical proportion of ocean plastic falls in small size fractions
C. Aside from clogging up the digestive tracts of marine life, plastic also tends to adsorb pollutants from the water column
D. Plastic in the oceans is arguably one of the most important and pervasive environmental problems today
E. Eating plastic has a number of negative consequences such as the retention of plastic particles in the gut for longer periods than normal food particles

cat2019-2 verbal-ability odd-one-out numerical-answer

### 5.13.19 Odd One Out: CAT 2020 Set-1 | Question: 20 top

Five jumbled up sentences, related to a topic, are given below. Four of them can be put together to form a coherent paragraph. Identify the odd one out and key in the number of the sentence as your answer:

A. Talk was the most common way for enslaved men and women to subvert the rules of their bondage, to gain more agency than they were supposed to have.
B. Even in conditions of extreme violence and unfreedom, their words remained ubiquitous, ephemeral, irrepressible, and potentially transgressive.
C. Slaves came from societies in which oaths, orations, and invocations carried great potency, both between people and as a connection to the all-powerful spirit world.
D. Freedom of speech and the power to silence may have been preeminent markers of white liberty in Colonies, but at the same time, slavery depended on dialogue: slaves could never be completely muted.
E. Slave − owners obsessed over slave talk, though they could never control it, yet feared its power to bind and inspire − for, as everyone knew, oaths, whispers, and secret conversations bred conspiracy and revolt.

### 5.13.20 Odd One Out: CAT 2020 Set-2 | Question: 19 top

Five jumbled up sentences, related to a topic, are given below. Four of them can be put together to form a coherent paragraph.

Identify the odd one out and key in the number of the sentence as your answer:

1. The victim's trauma after assault rarely gets the attention that we lavish on the moment of damage that divided the survivor from a less encumbered past.
2. One thing we often do with narratives of sexual assault is sort their respective parties into different temporalities: it seems we are interested in perpetrators' futures and victims' pasts.
3. One result is that we don't have much of a vocabulary for what happens in a victim's life after the painful past has been excavated, even when our shared language gestures toward the future, as the term "survivor" does.
4. Even the most charitable questions asked about the victims seem to focus on the past, in pursuit of understanding or of corroboration of painful details.
5. As more and more stories of sexual assault have been made public in the last two years, the genre of their telling has exploded … crimes have a tendency to become not just stories but genres.

### 5.13.21 Odd One Out: CAT 2020 Set-2 | Question: 21 top

Five jumbled up sentences, related to a topic, are given below. Four of them can be put together to form a coherent paragraph. Identify the odd one out and key in the number of the sentences as your answer:

1. You can observe the truth of this in every e-business model ever constructed: monopolise and protect data.
2. Economists and technologists believe that a new kind of capitalism is being created-different from industrial capitalism as was merchant capitalism.
3. In 1962, Kenneth Arrow, the guru of mainstream economics, said that in a free market economy the purpose of inventing things is to create intellectual property rights.
4. There is, alongside the world of monopolised information and surveillance, a different dynamic growing up: information as a social good, incapable of being owned or exploited or priced.
5. Yet information is abundant. Information goods are freely replicable. Once a thing is made, it can be copied and pasted infinitely.

cat2020-set2 verbal-ability odd-one-out numerical-answer

### 5.13.22 Odd One Out: CAT 2020 Set-3 | Question: 20 top

Although one of the most contested concepts in political philosophy, human nature is something on which most people seem to agree. By and large, according to Rutger Bregman in his new book Humankind, we have a rather pessimistic view – not of ourselves exactly, but of everyone else. We see other people as selfish, untrustworthy and dangerous and therefore we behave towards them with defensiveness and suspicion. This was how the 17th– century philosopher Thomas Hobbes conceived our natural state to be, believing that all that stood between us and violent anarchy was a strong state and firm leadership.

But in following Hobbes, argues Bregman, we ensure that the negative view we have of human nature is reflected back at us. He instead puts his faith in Jean – Jacques Rousseau, the 18th– century French thinker, who famously declared that man was born free and it was civilisation – with its coercive powers, social classes and restrictive laws – that put him in chains.

Hobbes and Rousseau are seen as the two poles of the human nature argument and it's no surprise that Bregman strongly sides with the Frenchman. He takes Rousseau's intuition and paints a picture of a prelapsarian idyll in which, for the better part of 300, 000 years, Homo sapiens lived a fulfilling life in harmony with nature … Then we discovered agriculture and for the next 10, 000 years it was all property, war, greed and injustice …

It was abandoning our nomadic lifestyle and then domesticating animals, says Bregman, that brought about infectious diseases such as measles, smallpox, tuberculosis, syphilis, malaria, cholera and plague. This may be true, but what Bregman never really seems to get to grips with is that pathogens were not the only things that grew with agriculture – so did the number of humans. It's one thing to maintain friendly relations and a property-less mode of living when you're 30 or 40 hunter-gatherers following the food. But life becomes a great deal more complex and knowledge far more extensive when there are settlements of many thousands.

"Civilisation has become synonymous with peace and progress and wilderness with war and decline," writes Bregman. "In reality, for most of human existence, it was the other way around." Whereas traditional history depicts the collapse of civilisations as "dark ages" in which everything gets worse, modern scholars, he claims, see them more as a reprieve, in which the enslaved gain their freedom and culture flourishes. Like much else in this book, the truth is probably somewhere between the two stated positions.

In any case, the fear of civilisational collapse, Bregman believes, is unfounded. It's the result of what the Dutch biologist Frans de Waal calls "veneer theory" – the idea that just below the surface, our bestial nature is waiting to break out… There's a great deal of reassuring human decency to be taken from this bold and though-provoking book and a wealth of evidence in support of the contention that the sense of who we are as a species has been deleteriously distorted. But it seems equally misleading to offer the false choice of Rousseau and Hobbes when, clearly, humanity encompasses both.

Five jumbled up sentences, related to a topic, are given below. Four of them can be put together to form a coherent paragraph. Identify the odd one out and key in the number of the sentence as your answer:

A. The logic of displaying one's inner qualities through outward appearance was based on a distinction between being a woman and being feminine.
B. 'Appearance' became a signifier of conduct – to look was to be and conformity to the feminine ideal was measured by how well women could use the tools of the fashion and beauty industries.
C. The makeover-centric media sets out subtly and not-so-subtly, 'good' and 'bad' ways to be a woman, layering these over inequalities of race and class.
D. The denigration of working-class women and women of colour often centres on their perceived failure to embody feminine beauty.
E. 'Woman' was considered a biological category, but femininity was a 'process' by which women became specific kinds of women.

### 5.13.23 Odd One Out: CAT 2020 Set-3 | Question: 26 top

Five jumbled up sentences, related to a topic, are given below. Four of them can be put together to form a coherent paragraph. Identify the odd one out and key in the number of the sentence as your answer:

A. Machine learning models are prone to learning human-like biases from the training data that feeds these algorithms.
B. Hate speech detection is part of the on-going effort against oppressive and abusive language on social media.
C. The current automatic detection models miss out on something vital: context.
D. It uses complex algorithms to flag racist or violent speech faster and better than human beings alone.
E. For instance, algorithms struggle to determine if group identifiers like "gay" or "black" are used in offensive or prejudiced ways because they're trained on imbalanced datasets with unusually high rates of hate speech.

### 5.13.25 Odd One Out: CAT 2021 Set-1 | Verbal Ability and Reading Comprehension | Question: 23 top

Five jumbled up sentences, related to a topic, are given below. Four of them can be put together to form a coherent paragraph. Identify the odd one out and key in the number of the sentence as your answer:

1. The legal status of resources mined in space remains ambiguous; and while the market for asteroid minerals is currently nonexistent, this is likely to change as technical hurdles diminish.
2. Outer space is a commons, and all of it is open for exploration, however, space law developed in the 1950s and 60s is state-centric and arguably ill-suited to a commercial future.
3. Laws adopted by the US and Luxembourg are first steps, but they only protect firms from competing claims by their compatriots; a Chinese company will not be bound by US law.
4. Critics say the US is conferring rights that it has no authority to confer; Russia in particular has condemned this, citing this US' disrespect for international law.
5. At issue now is commercial activity, as private firms–rather than nation states–look to space for profit.

cat2021-set1 verbal-ability odd-one-out numerical-answer

### 5.13.26 Odd One Out: CAT 2021 Set-2 | Verbal Ability and Reading Comprehension | Question: 22 top

Five jumbled up sentences, related to a topic, are given below. Four of them can be put together to form a coherent paragraph. Identify the odd one out and key in the number of the sentence as your answer:

A. The care with which philosophers examine arguments for and against forms of biotechnology makes this an excellent primer on formulating and assessing moral arguments.
B. Although most people find at least some forms of genetic engineering disquieting, it is not easy to articulate why: what is wrong with re-engineering our nature?
C. Breakthroughs in genetics present us with the promise that we will soon be able to prevent a host of debilitating diseases, and the predicament that our newfound genetic knowledge may enable us to enhance our genetic traits.
D. To grapple with the ethics of enhancement, we need to confront questions that verge on theology, which is why modern philosophers and political theorists tend to shrink from them.
E. One argument is that the drive for human perfection through genetics is objectionable as it represents a bid for mastery that fails to appreciate the gifts of human powers and achievements.

cat2021-set2 verbal-ability odd-one-out numerical-answer

### 5.13.27 Odd One Out: CAT 2021 Set-2 | Verbal Ability and Reading Comprehension | Question: 24 top

Five jumbled up sentences, related to a topic, are given below. Four of them can be put together to form a coherent paragraph. Identify the odd one out and key in the number of the sentence as your answer:

A. It has taken on a warm, fuzzy glow in the advertising world, where its potential is being widely discussed, and it is being claimed as the undeniable wave of the future.
B. There is little enthusiasm for this in the scientific arena; for them marketing is not a science, and only a handful of studies have been published in scientific journals.
C. The new, growing field of neuromarketing attempts to reveal the inner workings of consumer behaviour and is an extension of the study of how choices and decisions are made.
D. Some see neuromarketing as an attempt to make the “art” of advertising into a science, being used by marketing experts to back up their proposals with some form of real data.
E. The marketing gurus have already started drawing on psychology in developing tests and theories, and advertising people have borrowed the idea of the focus group from social scientists.

### 5.13.29 Odd One Out: CAT 2021 Set-3 | Verbal Ability and Reading Comprehension | Question: 21 top

Five jumbled up sentences, related to a topic, are given below. Four of them can be put together to form a coherent paragraph. Identify the odd one out and key in the number of the sentence as your answer:

A. A typical example is Wikipedia, where the overwhelming majority of contributors are male and so the available content is skewed to reflect their interests.
B. Without diversity of thought and representation, society is left with a distorted picture of future options, which are likely to result in augmenting existing inequalities.
C. Gross gender inequality in the technology sector is problematic, not only for the industry-wide marginalisation of women, but because technology designs embody the values of their makers.
D. While redressing unequal representation in the workplace is a step in the right direction, broader social change is needed to address the structural inequalities embedded within the current organisation of work and employment.

E. If technology merely reflects the perspectives of the male stereotype, then new technologies are unlikely to accommodate the diverse social contexts within which they operate.

### 5.15.8 Paragraph Construction: CAT 1994 | Question: 7 top

Choose the alternative which suggests a coherent paragraph.

A. The remaining chapters were written by various authors to Jung's direction.

B. The chapter that bears his name is his work and nobody else's.

C. The final editing of the complete work after Jung's death has been done by Dr. Von Franz.

D. It was written, incidentally, in English.

A. CBDA B. ADBC C. ACDB D. DCBA

cat1994 english-language paragraph-construction

Answer key

### 5.15.9 Paragraph Construction: CAT 1994 | Question: 8 top

Choose the alternative which suggests a coherent paragraph.

A. It is beyond our powers to predict the future.

B. Your own life, or your band's, or even your species' might be owed to a restless few.

C. Long summers, mild winters, which harvests, plentiful game — none of them lasts forever.

D. Catastrophic events have a way of sneaking up on us, of catching us unaware.

A. ADCB B. BCDA C. ACDB D. BDCA

cat1994 english-language paragraph-construction

Answer key

### 5.15.10 Paragraph Construction: CAT 1994 | Question: 9 top

Choose the alternative which suggests a coherent paragraph.

A. The quintessence, for example, a lizard is only fully understandable in the light of the particular possibilities and limitations dictated by its reptilian nature.

B. The films we made, tried to document the lives of particular animals showing how each found its food, defended itself and courted etc

C. We seldom examined the basic character of its anatomy.

D. One element, however, was missing.

A. ACBD B. BADC C. ADBC D. CDAB

cat1994 english-language paragraph-construction

Answer key

### 5.15.11 Paragraph Construction: CAT 1995 | Question: 26 top

Arrange the sentences in a proper sequence so as to make a coherent paragraph.

Arrange the sentences in a proper sequence so as to make a coherent paragraph.

A. Realists believe that there is an objective reality “out there” independent of ourselves.

B. This reality exists solely by virtue of how the world is and is discoverable by application of the methods of science.

C. They believe in the possibility of determining whether or not a theory is indeed really true or false.

D. I think it is fair to say that this is the position to which most working scientists subscribe.

A. ACBD B. CDBA C. DCBA D. BCAD

cat1995 english-language paragraph-construction

### 5.15.12 Paragraph Construction: CAT 1995 | Question: 27 top

Arrange the sentences in a proper sequence so as to make a coherent paragraph.

A. There is a strong manufacturing base for a variety of products.

B. India has come a long way on the technology front.

C. But the technology adopted has been largely of foreign origin.

D. There are, however, areas such as atomic energy, space, agriculture and defense where significant strides have been made in evolving relevant technologies within the country.

A. ADCB B. DBAC
C. BACD D. CBAD

cat1995 english-language paragraph-construction

### 5.15.13 Paragraph Construction: CAT 1995 | Question: 28 top

Arrange the sentences in a proper sequence so as to make a coherent paragraph.

A. In emission trading, the government fixes the total amount of pollution that is acceptable to maintain a desired level of air quality.

B. Economists argue that this approach makes air pollution control more costeffective than the current practice of fixing air-pollution standards and expecting all companies to pollute below these standards.

C. The USA uses emissions trading to control air pollution.

D. It then distributes emission permits to all companies in the region, which add up to the overall acceptable level of emission.

A. BADC B. ACDB C. CBAD D. DBAC

cat1995 english-language paragraph-construction

### 5.15.14 Paragraph Construction: CAT 1995 | Question: 29 top

Arrange the sentences in a proper sequence so as to make a coherent paragraph.

A. The individual companies vary in size, from the corner grocery to the industrial giant.

B. Policies and management methods within firms range from formal, well-planned organisations and controls to slipshod dayto-day operations.

C. Various industries offer a wide array of products or services through millions of firms largely independent of each other.

A. DBCA B. CADB C. BADC D. ADCB

cat1995 english-language paragraph-construction

### 5.15.15 Paragraph Construction: CAT 1995 | Question: 30 top

Arrange the sentences in a proper sequence so as to make a coherent paragraph.

A. All levels of demand, whether individual, aggregate, local, national, or international are subject to change.

B. At the same time, science and technology add new dimensions to products, their uses, and the methods used to market them.

C. Aggregate demand fluctuates with changes in the level of business activity, GNP, and national income.

D. The demands of individuals tend to vary with changing needs and rising income.

A. CBDA B. DCAB C. BCAD D. ADCB

cat1995 english-language paragraph-construction

### 5.15.16 Paragraph Construction: CAT 1995 | Question: 31 top

Arrange sentences A B, C, and D between sentences 1 and 6, so as to form a logical sequence of six sentences.

1. Chichen Itza, last outpost of the Mayan civilization, was built in the heat of the arid Yucatan peninsula, unlike most of the earlier Mayan cities, which were built in rain forests.

A. If she survived in the dark water until midday, priests hauled her out to ask what the gods had hold her

B. In times of crisis, a maiden was hurled at dawn into the 60-ft. deep hole in the limestone rock.

C. The city folks drank from one well and used the other as a well of sacrifice.

D. It got its water from two wells known as cenotes, fed by underwater streams.

6. The Mayans also threw cherished possessions into the hole-carved jade, gold, nodules of resin uses as incense, copper discs and human skeletons have all been dredged out of it.

A. DCBA B. BCAD C. CADB D. ABCD

cat1995 english-language paragraph-construction

### 5.15.17 Paragraph Construction: CAT 1995 | Question: 32 top

Arrange sentences A B, C, and D between sentences 1 and 6, so as to form a logical sequence of six sentences.

1. All human beings are aware of the existence of a power greater than that of the mortals — the name given to such a power by individuals is an outcome of birth, education and choice.

A. This power provides an anchor in times of adversity, difficulty and trouble.

B. Industrial organisations also contribute to the veneration of this power by participating in activities such as religious ceremonies and festivities organized by the employees.

C. Their other philanthropic contributions include the construction and maintenance of religious places such as temples or gurudwaras.

D. Logically, therefore, such a power should be remembered in good times also.

6. The top management/managers should participate in all such events, irrespective of their personal choice.

A. ADBC B. BCAD C. CADB D. DACB

cat1995 english-language paragraph-construction

### 5.15.18 Paragraph Construction: CAT 1995 | Question: 33 top

Arrange sentences A B, C, and D between sentences 1 and 6, so as to form a logical sequence of six sentences.

1. Total forgiveness for a mistake committed generates a sense of complacency towards target achievement among the employees.

A. In such a situation, the work ethos gets distorted and individuals get a feeling that they can get away with any lapse.

B. The feeling that they develop is 'whether I produce results or not, the management will not punish me or does not have the guts to punish me.'

C. Also, excess laxity damages management credibility, because for a long time, the management has maintained that dysfunctional behaviour will result in punishment, and when something goes wrong, it fails to take specific punitive action.

D. The severity of the punishment may be reduced by modifying it, but some action must be taken against the guilty so as to serve as a reminder for all others in the organisation.

6. Moreover, it helps establish the management's image of being firmed, fair and yet human.

A. DCBA B. BADC C. DBCA D. CABD

cat1995 english-language paragraph-construction

### 5.15.19 Paragraph Construction: CAT 1995 | Question: 34 top

Arrange sentences A B, C, and D between sentences 1 and 6, so as to form a logical sequence of six sentences.

1. Currency movements can have a dramatic impact on equity returns for foreign investors.

A. This is not surprising as many developing economies try to peg their exchange rates to the US dollar or to a basket of currencies.

B. Many developing economies manage to keep exchange rate volatility lower than that in the industrial economics.

C. India has also gone in for the full float on the current account and abolished the managed exchange rate.

D. Dramatic exceptions are Argentina, Brazil, and Nigeria.

6. Another emerging-market-specific risk is liquidity risk.

A. ADBC B. CDAB C. BDAC D. CABD

cat1995 english-language paragraph-construction

### 5.15.20 Paragraph Construction: CAT 1995 | Question: 35 top

Arrange sentences A B, C, and D between sentences 1 and 6, so as to form a logical sequence of six sentences.

1. Managers must lead by example; they should not be averse to giving a hand in manual work, if required.

A. They should also update their competence to guide their subordinates; this would be possible only if they keep in regular touch with new processes, machines, instruments, gauges, systems and gadgets.

B. Work must be allocated to different groups and team members in clear, specific terms.

C. Too much of wall-building is detrimental to the exercise of the 'personal charisma' of the leader whose presence should not be felt only through notices, circulars or memos, but by being seen physically.

D. Simple, clean living among one's people should be insisted upon.

6. This would mean the maintaining of an updated organisation chart; laying down job descriptions; identifying key result areas; setting personal targets; and above all, monitoring of performance, to meet organisational goals.

A. BDAC B. BCDA C. ADCB D. ACDB

cat1995 english-language paragraph-construction

Answer key

### 5.15.21 Paragraph Construction: CAT 1995 | Question: 36 top

Arrange sentences A B, C, and D between sentences 1 and 6, so as to form a logical sequence of six sentences.

1. The top management should perceive the true worth of people and only then make friends.

A. Such 'true friends' are very few and very rare.

B. Factors such as affluence, riches, outward sophistication and conceptual abilities are not prerequisites for genuine friendship.

C. Such people must be respected and kept close to the heart.

D. Business realities call for developing a large circle of acquaintances and contracts; however, all of them will be motivated by their own self-interest and it would be wrong to treat them as genuine friends.

6. There is always a need for real friends to whom one can turn for balanced, unselfish advice, more so when one is caught in a dilemma.

A. ABCD B. ADBC C. ABDC D. ACBD

cat1995 english-language paragraph-construction

### 5.15.22 Paragraph Construction: CAT 1995 | Question: 37 top

Arrange sentences A B, C, and D between sentences 1 and 6, so as to form a logical sequence of six sentences.

1. Conflicting demands for resources are always voiced by different functions/departments in an organisation.

A. Every manager examines the task entrusted to him and evaluates the resources required.

B. Availability of resources in full measure makes task achievement easy, because it reduces the effort needed to somehow make-do.

C. A safety cushion is built into demand for resources, to offset the adverse impact of any cut imposed by the seniors.

D. This aspect needs to be understood as the reality.

6. Dynamic, energetic, growth-oriented and wise managements are always confronted with the inadequacy of resources with respect to one of the four M's (men, machines, money and materials) and the two T's (time and technology).

A. DABC B. ACBD C. ABCD D. BCDA

cat1995 english-language paragraph-construction

### 5.15.23 Paragraph Construction: CAT 1995 | Question: 38 top

Arrange sentences A B, C, and D between sentences 1 and 6, so as to form a logical sequence of six sentences.

1. The Ethiopians, who believe that they are God's chosen people have a special legend to justify their confidence.

A. According to the legend, God molded the first man from clay.

B. He took the second burnt and black, so he threw them away to the South of Africa.

C. He took the second batch out too soon and they were pasty and white, so he threw them away to the North, where they became Arabs and Europeans.

D. He put the first batch in the oven to bake but left them too long.

6. The third batch came out just right and he put them in Ethiopia.

A. ADBC B. DCBA C. BACD D. CBDA

cat1995 english-language paragraph-construction

### 5.15.24 Paragraph Construction: CAT 1995 | Question: 39 top

Arrange sentences A B, C, and D between sentences 1 and 6, so as to form a logical sequence of six sentences.

1. According to Greek myth, Pandora was the first woman.

A. Only hope was left.

B. She was sent to the rebellious Zeus as a punishment for mankind

C. She was given a box to take with her, with instructions not to open it.

D. Because she was curious, she disobeyed, opened the box and all the evils of the world flew out.

6. Pandora's box has since become a symbol for any action whose consequences are dangerously unpredictable.

A. DCBA B. ABCD C. BCDA D. CADB

cat1995 english-language paragraph-construction

### 5.15.25 Paragraph Construction: CAT 1995 | Question: 40 top

Arrange sentences A B, C, and D between sentences 1 and 6, so as to form a logical sequence of six sentences.

1. Despite the passage of time, a large number of conflicts continue to remain alive, because the wronged parties, in reality or in imagination, wish to take revenge upon each other, thus creating a vicious circle.

A. At times, managers are called upon to take ruthless decisions in the long-term interests of the organisation.

B. People hurt others, at times knowingly, to teach them a lesson and, at other times, because they lack correct understanding of the other person have stand.

C. The delegation of any power, to any person, is never absolute.

D. Every ruthless decision will be easier to accept if the situation at the moment of committing the act is objectively analyzed, shared openly and discussed rationally.

6. if power is misused, its effects can last only for a while, since employees are bound to confront it someday, more so, the talented ones.

A. BCAD B. ADBC C. DABC D. BADC

cat1995 english-language paragraph-construction

### 5.15.26 Paragraph Construction: NIELIT 2016 MAR Scientist D: 56 top

Before the printing press, books could be purchased only in expensive manuscript copies. The printing press produced books that were significantly less expensive than the manuscript editions. The public's demand for printed books in the first years after the invention of printing press was many times greater than demand had been for manuscript copies. This increase demonstrates that there was a dramatic jump in the number of people who learned how to read in the years after publishers first started producing books on the printing press. Which one of the following statements, if true, casts doubt on the argument?

A. During the first years after the invention of printing press, letter writing by people who wrote without the assistance of scribes or clerks exhibited a dramatic incerase.
B. Books produced on the printing press are often found with written comments in the margins in the handwriting of the people who owned the books.
C. In the first years after the printing press was invented, printed books were purchased primarily by people who had always bought and read expensive manuscripts but could afford a greater number of printed books for the same money.
D. Books that were printed on the printing press in the first years after its invention often circulated among friends in informal reading clubs or libraries.

### 5.15.27 Paragraph Construction: NIELIT 2016 MAR Scientist D: 57 top

Bevex, an artificial sweetener used only in the soft drinks, is carcinogenic for mice, but only when it is consumed in very large quantities. To ingest an amount of Bevex equivalent to the amount fed to the mice in the relevant studies, a person would have to drink 25 cans of Bevex sweetened soft drinks per day. For that reason, Bevex is in fact safe for people.

In order for the conclusion that Bevex is safe for people to be properly drawn, which one of the following must be true?

A. Cancer from carcinogenic substances develops more slowly in mice than it does in people.
B. If all food additives that are currently used in foods were tested, some would be found to be carcinogenic for mice.
C. People drink fewer than 25 cans of Bevex-sweetened soda per day.
D. People can obtain important health benefits by controlling their weight through the use of artificially sweetened soft drinks.

### 5.15.28 Paragraph Construction: NIELIT 2016 MAR Scientist D: 60 top

Many environmentalists have urged environmental awareness on consumers, saying that if we accept moral responsibility for our effects on the environment, then products that directly or indirectly harm the environment ought to be avoided. Unfortunately it is usually impossible for consumers to assess the environmental impact of a product, and thus impossible for them to consciously restrict their purchases to environmentally benign products. Because of this impossibility there can be no moral duty to choose products in the way these environmentalists urge, since _____.

Which one of the following principles provides the most appropriate completion for the argument?

A. a moral duty to perform an action is never based solely on the effects the action will have on other people
B. a person cannot possibly have a moral duty to do what he or she is unable to do
C. moral considerations should not be the sole determinants of what products are made available to consumers
D. the morally right action is always the one whose effects produce the least total harm

passage-reading

Answer key

## 5.16.2 Passage Reading: CAT 1997 | Question: 99 top

Read the passages given below carefully and answer the questions that follow.

Water plays a versatile role in the functioning of the biosphere. The water cycle has two distinct branches – the atmospheric branch and the terrestrial branch. In the atmosphere, water exists mainly in gaseous form. On the earth, liquid forms and solid forms (ice/snow) predominate.

Water is important to the biosphere in that it is from water that the biosphere draws its most, abundant element, hydrogen. Hydrogen in the form of carbohydrates constitutes a very important source of energy for all living things. Although we have a plentiful supply of water in the oceans, it is not of direct use to use. We have to depend upon a small stock of water - less than 1% - contained in our rivers and freshwater lakes and in the subsoil. Even this small proportion can cause havoc to life if it is not properly managed: the reference here is to floods.

While relief measures are undoubtedly important, attention has to be focused on long-term flood control measures. In the past, we had constructed flood moderation reservoirs across catchment's areas of rivers and built 19, 260 km of embankments and 27, 850 km length of drainage channels. Besides 18, 900 villages have been raised above the flood level up to March 1997.

The fact is that long-term flood control measures, to be effective, should include both traditional methods and a forestation measures. The intensity of floods may be reduced by keeping the drainage channels clear and removing the accumulated silt from reservoirs and riverbeds. In fact, the dams built have trapped silt coming from the hills and prevented its large accumulation in riverbeds downstream. Hence the new emphasis on building more dams in the northern rivers should be welcomed. The embankments also need to be reinforced. In many places, they are just made of mud and sand and easily breached by a little gush of water. Other improvements should be in the regulation of water discharge from filled reservoirs and in the flood forecasting system. Even the present warning system, though inadequate, has helped to save many valuable lives and property. Since the states have been lethargic in implementing flood control schemes and since most rivers flow through many states, it would be better if flood control is handled by the Centre. The mighty Himalayan rivers are unlikely to be tamed unless we have a basic understanding as to how floods originate. Since 1947, Indian and foreign scientists have been repeatedly emphasising that the volume of water in the Himalayan rivers in the monsoons is the combined effect of rainfall, snowmelt and glacier discharges. Even the first expert committed to set up by Nehru had opined that a serious study of the snow melt and glacier discharges are essential for avoiding flood disasters in the north. But efforts in this direction during the last 50 years have been very inadequate. Now that satellite pictures are available detailing the snow cover in the Himalayas over large areas it would do well to initiate measures to obtain the relevant data from such pictures. Field studies in the Himalayan region would also help flood control measures.

A deficiency in the flood control measures contributing to the intensity of floods is the:

1. Clearing up of the drainage channels
2. Desilting of reservoirs built across the catchment areas of rivers
3. Desilting of river beds
4. Embankments are weak

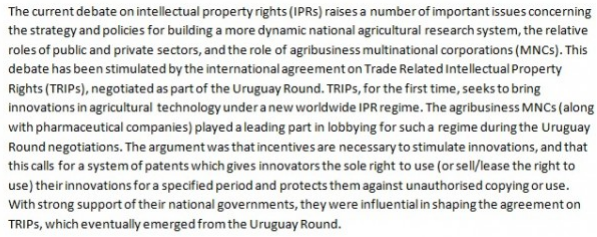
## 5.16.3 Passage Reading: CAT 2000 | Question: 1 top

**The passage given below is followed by a question. Choose the best answer.**



The current debate on intellectual property rights (IPRs) raises a number of important issues concerning the strategy and policies for building a more dynamic national agricultural research system, the relative roles of public and private sectors, and the role of agribusiness multinational corporations (MNCs). This debate has been stimulated by the international agreement on Trade Related Intellectual Property Rights (TRIPs), negotiated as part of the Uruguay Round. TRIPs, for the first time, seeks to bring innovations in agricultural technology under a new worldwide IPR regime. The agribusiness MNCs (along with pharmaceutical companies) played a leading part in lobbying for such a regime during the Uruguay Round negotiations. The argument was that incentives are necessary to stimulate innovations, and that this calls for a system of patents which gives innovators the sole right to use (or sell/lease the right to use) their innovations for a specified period and protects them against unauthorised copying or use. With strong support of their national governments, they were influential in shaping the agreement on TRIPs, which eventually emerged from the Uruguay Round.

The current debate on intellectual property rights (IPRs) raises a number of important issues concerning the strategy and policies for building a more dynamic national agricultural research system, the relative roles of public and private sector, and the role of agribusiness multinational corporations (MNCs). Theis debate has been stimulated by the international agreement on Trade Related Intellectual Property Rights (TRIPs), negotiated as part of the Uruguay Round. TRIPs, for the first time, seeks to bring innovations in agricultural technology under a new worldwide IPR regime. The agribusiness MNCs (along with pharmaceutical companies) played a leading part in lobbying for such a regime during the Uruguay Round negotiations. The argument was that incentives are necessary to stimulate innovations, and that this calls for a system of patents which gives innovators the sole right to use (or sell/lease the right to use) their innovations for a specified period and protests them against unauthorised copying or use. With strong support of their national governments, they were influential shaping in shaping the

agreements on TRIPs, which eventually emerged from the Uruguay Round.

The current debate on TRIPs in India- as indeed elsewhere- echoes wider concerns about 'privatisation' of research and allowing a free field for MNCs in the sphere of biotechnology and agriculture. The agribusiness corporations, and those with unbounded faith in the power of science to overcome all likely problems, point to the vast potential that new technology holds for solving the problems of hunger, malnutrition and poverty in the world. The exploitation of this potential should be encouraged and this is best done by the private sector for which patents are essential. Some, who do not necessarily accept this optimism, argue that fears of MNC domination are exaggerated and that farmers will accept their products only if they decisively outperform the available alternatives. Those who argue against agreeing to introduce an IPR regime in agriculture and encouraging private sector research are apprehensive that this will work to the disadvantage of farmers by making them more and more dependent on monopolistic MNCs. A different, though related apprehension is that extensive use of hybrids and genetically engineered new varieties might increase the vulnerability of agriculture to outbreaks of pests and diseases. The larger, longer-term consequences of reduced biodiversity that may follow from the use of specially bred varieties are also another cause for concern. Moreover, corporations, driven by the profit motive, will necessarily tend to underplay, if not ignore, potential adverse consequences, especially those which are unknown and which may manifest themselves only over a relatively long period. On the other hand, high pressure advertising and aggressive sales campaigns by private companies can seduce farmers into accepting varieties without being aware of potential adverse effects and the possibility of disastrous consequences for their livelihood if these varieties happen to fail. There is no provision under the laws, as they now exist, for compensating users against such eventualities.

Excessive preoccupation with seeds and seed material has obscured other important issues involved in reviewing the research policy. We need to remind ourselves that improved varieties by themselves are not sufficient for sustained growth of yields. In our own experience, some of the early high yielding varieties (HYVs) of rice and wheat were found susceptible to widespread pest attacks; and some had problems of grain quality. Further research was necessary to solve these problems. This largely successful research was almost entirely done in public research institutions. Of course, it could in principle have been done by private companies, but whether they choose to do so depends crucially on the extent of the loss in market for their original introductions on account of the above factors and whether the companies are financially strong enough to absorb the 'losses', invest in research to correct the deficiencies and recover the lost market. Public research, which is not driven by profit, is better placed to take corrective action. Research for improving common pool resource management, maintaining ecological health and ensuring sustainability is both critical and also demanding in terms of technological challenge and resource requirements. As such research is crucial to the impact of new varieties, chemicals and equipment in the farmer's field, private companies should be interested in such research. But their primary interest is in the sale of seed material, chemicals, equipment and other inputs produced by them. Knowledge and techniques for resource management are not 'marketable' in the same way as those inputs. Their application to land, water and forests has a long gestation and their efficacy depends on resolving difficult problems such as designing institutions for proper and equitable management of common pool resources. Public or quasi-public research institutions informed by broader, long-term concerns can only do such work.

The public sector must therefore continue to play a major role in the national research system. It is both wrong and misleading to pose the problem in terms of public sector versus private sector or of privatisation of research. We need to address problems likely to arise on account of the publicprivatesector complementarily, and ensure that the public research system performs efficiently. Complementarily between various elements of research raises several issues in implementing an IPR regime. Private companies do not produce new varieties and inputs entirely as a result of their own research. Almost all technological improvement is based on knowledge and experience accumulated from the past, and the results of basic and applied research in public and quasi-public institutions (universities, research organisations). Moreover, as is increasingly recognised, accumulated stock of knowledge does not reside only in the scientific community and its academic publications, but is also widely diffused in traditions and folk knowledge of local communities all over.

The deciphering of the structure and functioning of DNA forms the basis of much of modern biotechnology. But this fundamental breakthrough is a 'public good' freely accessible in the public domain and usable free of any charge. Varieties/techniques developed using that knowledge can however be, and are, patented for private profit. Similarly, private corporations draw extensively, and without any charge, on germ plasm available in varieties of plants species (neem and turmeric are by now famous examples). Publicly funded gene banks as well as new varieties bred by public sector research stations can also be used freely by private enterprises for developing their own varieties and seek patent protection for them. Should private breeders be allowed free use of basic scientific discoveries? Should the repositories of traditional knowledge and germ plasm be collected which are maintained and improved by publicly funded institutions? Or should users be made to pay for such use? If they are to pay, what should be the basis of compensation? Should the compensation be for individuals or for communities/institutions to which they belong? Should individuals/ institutions be given the right of patenting their innovations? These are some of the important issues that deserve more attention than they now get and need serious detailed study to evolve reasonably satisfactory, fair and workable solutions. Finally, the tendency to equate the public sector with the government is wrong. The public space is much wider than government departments and includes co-operatives, universities, public trust and a variety of non-governmental organizations (NGOs). Giving greater autonomy to research organizations from government control and giving non-government public institutions the space and resources to play a larger, more effective role in research, is therefore an issue of direct relevance in restructuring the public research system.

Which one of the following statements describes an important issue, or important issues, not being raised in the context of the current debate on IPRs?

A. The role of MNCs in the sphere of biotechnology and agriculture.
B. The strategy and policies for establishing an IPR regime for Indian agriculture.
C. The relative roles of public and private sectors.
D. Wider concerns about 'privatisation' of research.

## 5.16.4 Passage Reading: CAT 2000 | Question: 10 top

**The passage given below is followed by a question. Choose the best answer.**

One of the criteria by which we judge the vitality of a style of painting is its ability to renew itself- its responsiveness to the changing nature and quality of experience, the degree of conceptual and formal innovation that it exhibits. By this criterion, it would appear that the practice of abstractionism has failed to engage creatively with the radical change in human experience in recent decades. It has, seemingly, been unwilling to re-invent itself in relation to the systems of artistic expression and viewers' expectations that have developed under the impact of the mass media. The judgment that abstractionism has slipped into 'inertia gear' is gaining endorsement, not only among discerning viewers and practitioners of other art forms, but also among abstract painters themselves. Like their companions elsewhere in the world, abstractionists in India are asking themselves an overwhelming question today: Does abstractionism have a future? The major crisis that abstractionists face is that of revitalising their picture surface; few have improvised any solutions beyond the ones that were exhausted by the 1970s. Like all revolutions, whether in politics or in art, abstractionism must now confront its moment of truth: having begun life as a new and radical pictorial approach to experience, it has become an entrenched orthodoxy itself. Indeed, when viewed against a historical situation in which a variety of subversive, interactive and richly hybrid forms are available to the art practitioner, abstractionism assumes the remote and defiant air of an aristocracy that has outlived its age: trammelled by formulaic conventions yet buttressed by a rhetoric of sacred mystery, it seems condemned to being the last citadel of the self-regarding 'fine art' tradition, the last hurrah of painting for painting's sake.

The situation is further complicated in India by the circumstances in which an indigenous abstractionism came into prominence here during the 1960s. From the beginning it was propelled by the dialectic between two motives, one revolutionary and the other conservative-it was inaugurated as an act of emancipation from the dogmas of the nascent Indian nation state, when art was officially viewed as an indulgence at worst, and at best, as an instrument for the celebration of the republic's hopes and aspirations. Having rejected these dogmas, the pioneering abstractionists also went on to reject the various figurative styles associated with the Shantiniketan circle and others. In such a situation, abstractionism was a revolutionary move. It led art towards the exploration of the subconscious mind, the spiritual quest and the possible expansion of consciousness. Indian painting entered into a phase of self-inquiry, a meditative inner space where cosmic symbols and non-representational images ruled. Often, the transition from figurative idioms to abstractionist ones took place within the same artist.

At the same time, Indian abstractionists have rarely committed themselves wholeheartedly to a nonrepresentational idiom. They have been preoccupied with the fundamentally metaphysical project of aspiring to the mystical-holy without altogether renouncing the symbolic. This has been sustained by a hereditary reluctance to give up the murti, the inviolable iconic form, which explains why abstractionism is marked by the conservative tendency to operate with images from the sacred repertoire of the past. Abstractionism thus entered India as a double-edged device in a complex cultural transaction. Ideologically, it served as an internationalist legitimisation of the emerging revolutionary local trends. However, on entry, it was conscripted to serve local artistic preoccupations– a survey of indigenous abstractionism will show that its most obvious points of affinity with European and American abstract art were with the more mystically oriented of the major sources of abstractionist philosophy and practice, for instance the KandinskyKlee school. There have been no takers for Malevich's Suprematism, which militantly rejected both the artistic forms of the past and the world of appearances, privileging the new-minted geometric symbol as an autonomous sign of the desire for infinity.

Against this backdrop, we can identify three major abstractionist idioms in Indian art. The first develops from a love of the earth, and assumes the form of a celebration of the self's dissolution in the cosmic panorama; the landscape is no longer a realistic transcription of the scene, but is transformed into a visionary occasion for contemplating the cycles of decay and regeneration. The second idiom phrases its departures from symbolic and archetypal devices as invitations to heightened planes of awareness. Abstractionism begins with the establishment or dissolution of the motif, which can be drawn from diverse sources, including the hieroglyphic tablet, the Sufi meditation dance or the Tantric diagram. The third idiom is based on the lyric play of forms guided by gesture or allied with formal improvisations like the assemblage. Here, sometimes, the line dividing abstract image from patterned design or quasirandom expressive marking may blur. The flux of forms can also be regimented through the poetics of pure colour arrangements, vector-diagrammatic spaces and gestural design.

In this genealogy, some pure lines of descent follow their logic to the inevitable point of extinction, others engage in cross-fertilization, and yet others undergo mutation to maintain their energy. However, this genealogical survey demonstrates the wave at its crests, those points where the metaphysical and the painterly have been fused in images of abiding potency, ideas sensuously ordained rather than fabricated programmatically to a concept. It is equally possible to enumerate the thoughts where the two principles do not come together, thus arriving at a very different account. Uncharitable as it may sound, the history of Indian abstractionism records a series of attempts to avoid the risks of abstraction by resorting to an overt and near-generic symbolism, which many Indian abstractionists embrace when they find themselves bereft of the imaginative energy to negotiate the union of metaphysics and painterliness.

Such symbolism falls into a dual trap: it succumbs to the pompous vacuity of pure metaphysics when the burden of intention is passed off as justification; or then it is desiccated by the arid formalism of pure painterliness, with delight in the measure of

chance or pattern guiding the execution of a painting. The ensuing conflict of purpose stalls the progress of abstractionism in an impasse. The remarkable Indian abstractionists are precisely those who have overcome this and addressed themselves to the basic elements of their art with a decisive sense of independence from prior models. In their recent work, we see the logic of Indian abstractionism pushed almost to the furthest it can be taken. Beyond such artists stands a lost generation of abstractionists whose work invokes a wistful, delicate beauty but stops there.

Abstractionism is not a universal language; it is an art that points up the loss of a shared language of signs in society. And yet, it affirms the possibility of its recovery through the effort of awareness. While its rhetoric has always emphasised a call for new forms of attention, abstractionist practice has tended to fall into a complacent pride in its own incomprehensibility; a complacency fatal in an ethos where vibrant new idioms compete for the viewers' attention. Indian abstractionists ought to really return to basics, to reformulate and replenish their understanding of the nature of the relationship between the painted image and the world around it. But will they abandon their favourite conceptual habits and formal conventions, if this becomes necessary?

Which one of the following, according to the author, is the role that abstractionism plays in a society?

A. It provides an idiom that can be understood by most members in a society.
B. It highlights the absence of a shared language of meaningful symbols which can be recreated through greater awareness.
C. It highlights the contradictory artistic trends of revolution and conservatism that any society needs to move forward.
D. It helps abstractionists invoke the wistful, delicate beauty that may exist in society.

## 5.16.5 Passage Reading: CAT 2000 | Question: 11 top

**The passage given below is followed by a question. Choose the best answer.**

One of the criteria by which we judge the vitality of a style of painting is its ability to renew itself- its responsiveness to the changing nature and quality of experience, the degree of conceptual and formal innovation that it exhibits. By this criterion, it would appear that the practice of abstractionism has failed to engage creatively with the radical change in human experience in recent decades. It has, seemingly, been unwilling to re-invent itself in relation to the systems of artistic expression and viewers' expectations that have developed under the impact of the mass media. The judgment that abstractionism has slipped into 'inertia gear' is gaining endorsement, not only among discerning viewers and practitioners of other art forms, but also among abstract painters themselves. Like their companions elsewhere in the world, abstractionists in India are asking themselves an overwhelming question today: Does abstractionism have a future? The major crisis that abstractionists face is that of revitalising their picture surface; few have improvised any solutions beyond the ones that were exhausted by the 1970s. Like all revolutions, whether in politics or in art, abstractionism must now confront its moment of truth: having begun life as a new and radical pictorial approach to experience, it has become an entrenched orthodoxy itself. Indeed, when viewed against a historical situation in which a variety of subversive, interactive and richly hybrid forms are available to the art practitioner, abstractionism assumes the remote and defiant air of an aristocracy that has outlived its age: trammelled by formulaic conventions yet buttressed by a rhetoric of sacred mystery, it seems condemned to being the last citadel of the self-regarding 'fine art' tradition, the last hurrah of painting for painting's sake.

The situation is further complicated in India by the circumstances in which an indigenous abstractionism came into prominence here during the 1960s. From the beginning it was propelled by the dialectic between two motives, one revolutionary and the other conservative-it was inaugurated as an act of emancipation from the dogmas of the nascent Indian nation state, when art was officially viewed as an indulgence at worst, and at best, as an instrument for the celebration of the republic's hopes and aspirations. Having rejected these dogmas, the pioneering abstractionists also went on to reject the various figurative styles associated with the Shantiniketan circle and others. In such a situation, abstractionism was a revolutionary move. It led art towards the exploration of the subconscious mind, the spiritual quest and the possible expansion of consciousness. Indian painting entered into a phase of self-inquiry, a meditative inner space where cosmic symbols and non-representational images ruled. Often, the transition from figurative idioms to abstractionist ones took place within the same artist.

At the same time, Indian abstractionists have rarely committed themselves wholeheartedly to a nonrepresentational idiom. They have been preoccupied with the fundamentally metaphysical project of aspiring to the mystical-holy without altogether renouncing the symbolic. This has been sustained by a hereditary reluctance to give up the murti, the inviolable iconic form, which explains why abstractionism is marked by the conservative tendency to operate with images from the sacred repertoire of the past. Abstractionism thus entered India as a double-edged device in a complex cultural transaction. Ideologically, it served as an internationalist legitimisation of the emerging revolutionary local trends. However, on entry, it was conscripted to serve local artistic preoccupations– a survey of indigenous abstractionism will show that its most obvious points of affinity with European and American abstract art were with the more mystically oriented of the major sources of abstractionist philosophy and practice, for instance the KandinskyKlee school. There have been no takers for Malevich's Suprematism, which militantly rejected both the artistic forms of the past and the world of appearances, privileging the new-minted geometric symbol as an autonomous sign of the desire for infinity.

Against this backdrop, we can identify three major abstractionist idioms in Indian art. The first develops from a love of the earth, and assumes the form of a celebration of the self's dissolution in the cosmic panorama; the landscape is no longer a realistic transcription of the scene, but is transformed into a visionary occasion for contemplating the cycles of decay and regeneration. The second idiom phrases its departures from symbolic and archetypal devices as invitations to heightened planes

of awareness. Abstractionism begins with the establishment or dissolution of the motif, which can be drawn from diverse sources, including the hieroglyphic tablet, the Sufi meditation dance or the Tantric diagram. The third idiom is based on the lyric play of forms guided by gesture or allied with formal improvisations like the assemblage. Here, sometimes, the line dividing abstract image from patterned design or quasirandom expressive marking may blur. The flux of forms can also be regimented through the poetics of pure colour arrangements, vector-diagrammatic spaces and gestural design.

In this genealogy, some pure lines of descent follow their logic to the inevitable point of extinction, others engage in cross-fertilization, and yet others undergo mutation to maintain their energy. However, this genealogical survey demonstrates the wave at its crests, those points where the metaphysical and the painterly have been fused in images of abiding potency, ideas sensuously ordained rather than fabricated programmatically to a concept. It is equally possible to enumerate the thoughts where the two principles do not come together, thus arriving at a very different account. Uncharitable as it may sound, the history of Indian abstractionism records a series of attempts to avoid the risks of abstraction by resorting to an overt and near-generic symbolism, which many Indian abstractionists embrace when they find themselves bereft of the imaginative energy to negotiate the union of metaphysics and painterliness.

Such symbolism falls into a dual trap: it succumbs to the pompous vacuity of pure metaphysics when the burden of intention is passed off as justification; or then it is desiccated by the arid formalism of pure painterliness, with delight in the measure of chance or pattern guiding the execution of a painting. The ensuing conflict of purpose stalls the progress of abstractionism in an impasse. The remarkable Indian abstractionists are precisely those who have overcome this and addressed themselves to the basic elements of their art with a decisive sense of independence from prior models. In their recent work, we see the logic of Indian abstractionism pushed almost to the furthest it can be taken. Beyond such artists stands a lost generation of abstractionists whose work invokes a wistful, delicate beauty but stops there.

Abstractionism is not a universal language; it is an art that points up the loss of a shared language of signs in society. And yet, it affirms the possibility of its recovery through the effort of awareness. While its rhetoric has always emphasised a call for new forms of attention, abstractionist practice has tended to fall into a complacent pride in its own incomprehensibility; a complacency fatal in an ethos where vibrant new idioms compete for the viewers' attention. Indian abstractionists ought to really return to basics, to reformulate and replenish their understanding of the nature of the relationship between the painted image and the world around it. But will they abandon their favourite conceptual habits and formal conventions, if this becomes necessary?

According to the author, which one of the following characterises the crisis faced by abstractionism?

A. Abstractionists appear to be unable to transcend the solutions tried out earlier.
B. Abstractionism has allowed itself to be confined by set forms and practices.
C. Abstractionists have been unable to use the multiplicity of forms now becoming available to an artist.
D. All of the above.

## 5.16.6 Passage Reading: CAT 2000 | Question: 12 top

**The passage given below is followed by a question. Choose the best answer.**

One of the criteria by which we judge the vitality of a style of painting is its ability to renew itself- its responsiveness to the changing nature and quality of experience, the degree of conceptual and formal innovation that it exhibits. By this criterion, it would appear that the practice of abstractionism has failed to engage creatively with the radical change in human experience in recent decades. It has, seemingly, been unwilling to re-invent itself in relation to the systems of artistic expression and viewers' expectations that have developed under the impact of the mass media. The judgment that abstractionism has slipped into 'inertia gear' is gaining endorsement, not only among discerning viewers and practitioners of other art forms, but also among abstract painters themselves. Like their companions elsewhere in the world, abstractionists in India are asking themselves an overwhelming question today: Does abstractionism have a future? The major crisis that abstractionists face is that of revitalising their picture surface; few have improvised any solutions beyond the ones that were exhausted by the 1970s. Like all revolutions, whether in politics or in art, abstractionism must now confront its moment of truth: having begun life as a new and radical pictorial approach to experience, it has become an entrenched orthodoxy itself. Indeed, when viewed against a historical situation in which a variety of subversive, interactive and richly hybrid forms are available to the art practitioner, abstractionism assumes the remote and defiant air of an aristocracy that has outlived its age: trammelled by formulaic conventions yet buttressed by a rhetoric of sacred mystery, it seems condemned to being the last citadel of the self-regarding 'fine art' tradition, the last hurrah of painting for painting's sake.

The situation is further complicated in India by the circumstances in which an indigenous abstractionism came into prominence here during the 1960s. From the beginning it was propelled by the dialectic between two motives, one revolutionary and the other conservative-it was inaugurated as an act of emancipation from the dogmas of the nascent Indian nation state, when art was officially viewed as an indulgence at worst, and at best, as an instrument for the celebration of the republic's hopes and aspirations. Having rejected these dogmas, the pioneering abstractionists also went on to reject the various figurative styles associated with the Shantiniketan circle and others. In such a situation, abstractionism was a revolutionary move. It led art towards the exploration of the subconscious mind, the spiritual quest and the possible expansion of consciousness. Indian painting entered into a phase of self-inquiry, a meditative inner space where cosmic symbols and non-representational images ruled. Often, the transition from figurative idioms to abstractionist ones took place within the same artist.

At the same time, Indian abstractionists have rarely committed themselves wholeheartedly to a nonrepresentational idiom. They have been preoccupied with the fundamentally metaphysical project of aspiring to the mystical-holy without altogether renouncing the symbolic. This has been sustained by a hereditary reluctance to give up the murti, the inviolable iconic form, which explains why abstractionism is marked by the conservative tendency to operate with images from the sacred repertoire of the past. Abstractionism thus entered India as a double-edged device in a complex cultural transaction. Ideologically, it served as an internationalist legitimisation of the emerging revolutionary local trends. However, on entry, it was conscripted to serve local artistic preoccupations– a survey of indigenous abstractionism will show that its most obvious points of affinity with European and American abstract art were with the more mystically oriented of the major sources of abstractionist philosophy and practice, for instance the KandinskyKlee school. There have been no takers for Malevich's Suprematism, which militantly rejected both the artistic forms of the past and the world of appearances, privileging the new-minted geometric symbol as an autonomous sign of the desire for infinity.

Against this backdrop, we can identify three major abstractionist idioms in Indian art. The first develops from a love of the earth, and assumes the form of a celebration of the self's dissolution in the cosmic panorama; the landscape is no longer a realistic transcription of the scene, but is transformed into a visionary occasion for contemplating the cycles of decay and regeneration. The second idiom phrases its departures from symbolic and archetypal devices as invitations to heightened planes of awareness. Abstractionism begins with the establishment or dissolution of the motif, which can be drawn from diverse sources, including the hieroglyphic tablet, the Sufi meditation dance or the Tantric diagram. The third idiom is based on the lyric play of forms guided by gesture or allied with formal improvisations like the assemblage. Here, sometimes, the line dividing abstract image from patterned design or quasirandom expressive marking may blur. The flux of forms can also be regimented through the poetics of pure colour arrangements, vector-diagrammatic spaces and gestural design.

In this genealogy, some pure lines of descent follow their logic to the inevitable point of extinction, others engage in cross-fertilization, and yet others undergo mutation to maintain their energy. However, this genealogical survey demonstrates the wave at its crests, those points where the metaphysical and the painterly have been fused in images of abiding potency, ideas sensuously ordained rather than fabricated programmatically to a concept. It is equally possible to enumerate the thoughts where the two principles do not come together, thus arriving at a very different account. Uncharitable as it may sound, the history of Indian abstractionism records a series of attempts to avoid the risks of abstraction by resorting to an overt and near-generic symbolism, which many Indian abstractionists embrace when they find themselves bereft of the imaginative energy to negotiate the union of metaphysics and painterliness.

Such symbolism falls into a dual trap: it succumbs to the pompous vacuity of pure metaphysics when the burden of intention is passed off as justification; or then it is desiccated by the arid formalism of pure painterliness, with delight in the measure of chance or pattern guiding the execution of a painting. The ensuing conflict of purpose stalls the progress of abstractionism in an impasse. The remarkable Indian abstractionists are precisely those who have overcome this and addressed themselves to the basic elements of their art with a decisive sense of independence from prior models. In their recent work, we see the logic of Indian abstractionism pushed almost to the furthest it can be taken. Beyond such artists stands a lost generation of abstractionists whose work invokes a wistful, delicate beauty but stops there.

Abstractionism is not a universal language; it is an art that points up the loss of a shared language of signs in society. And yet, it affirms the possibility of its recovery through the effort of awareness. While its rhetoric has always emphasised a call for new forms of attention, abstractionist practice has tended to fall into a complacent pride in its own incomprehensibility; a complacency fatal in an ethos where vibrant new idioms compete for the viewers' attention. Indian abstractionists ought to really return to basics, to reformulate and replenish their understanding of the nature of the relationship between the painted image and the world around it. But will they abandon their favourite conceptual habits and formal conventions, if this becomes necessary?

According to the author, the introduction of abstractionism was revolutionary because it

A. celebrated the hopes and aspirations of a newly independent nation.
B. provided a new direction to Indian art,towards self-inquiry and nonrepresentational images.
C. managed to obtain internationalist support for the abstractionist agenda.
D. was emancipation from the dogmas of the nascent nation state.

## 5.16.7 Passage Reading: CAT 2000 | Question: 13 top

**The passage given below is followed by a question. Choose the best answer.**

One of the criteria by which we judge the vitality of a style of painting is its ability to renew itself- its responsiveness to the changing nature and quality of experience, the degree of conceptual and formal innovation that it exhibits. By this criterion, it would appear that the practice of abstractionism has failed to engage creatively with the radical change in human experience in recent decades. It has, seemingly, been unwilling to re-invent itself in relation to the systems of artistic expression and viewers' expectations that have developed under the impact of the mass media. The judgment that abstractionism has slipped into 'inertia gear' is gaining endorsement, not only among discerning viewers and practitioners of other art forms, but also among abstract painters themselves. Like their companions elsewhere in the world, abstractionists in India are asking themselves an overwhelming question today: Does abstractionism have a future? The major crisis that abstractionists face is that of revitalising their picture surface; few have improvised any solutions beyond the ones that were exhausted by the 1970s. Like all revolutions, whether in politics or in art, abstractionism must now confront its moment of truth: having begun life as a new and radical pictorial approach to experience, it has become an entrenched orthodoxy itself. Indeed, when viewed against a historical situation in which a variety of subversive, interactive and richly hybrid forms are available to the art practitioner, abstractionism assumes the remote and defiant air of an aristocracy that has outlived its age: trammelled by formulaic conventions yet buttressed by a rhetoric of sacred mystery, it seems condemned to being the last citadel of the self-regarding 'fine art' tradition, the last hurrah of painting for painting's sake.

The situation is further complicated in India by the circumstances in which an indigenous abstractionism came into prominence here during the 1960s. From the beginning it was propelled by the dialectic between two motives, one revolutionary and the other conservative-it was inaugurated as an act of emancipation from the dogmas of the nascent Indian nation state, when art was officially viewed as an indulgence at worst, and at best, as an instrument for the celebration of the republic's hopes and aspirations. Having rejected these dogmas, the pioneering abstractionists also went on to reject the various figurative styles associated with the Shantiniketan circle and others. In such a situation, abstractionism was a revolutionary move. It led art towards the exploration of the subconscious mind, the spiritual quest and the possible expansion of consciousness. Indian painting entered into a phase of self-inquiry, a meditative inner space where cosmic symbols and non-representational images ruled. Often, the transition from figurative idioms to abstractionist ones took place within the same artist.

At the same time, Indian abstractionists have rarely committed themselves wholeheartedly to a nonrepresentational idiom. They have been preoccupied with the fundamentally metaphysical project of aspiring to the mystical-holy without altogether renouncing the symbolic. This has been sustained by a hereditary reluctance to give up the murti, the inviolable iconic form, which explains why abstractionism is marked by the conservative tendency to operate with images from the sacred repertoire of the past. Abstractionism thus entered India as a double-edged device in a complex cultural transaction. Ideologically, it served as an internationalist legitimisation of the emerging revolutionary local trends. However, on entry, it was conscripted to serve local artistic preoccupations– a survey of indigenous abstractionism will show that its most obvious points of affinity with European and American abstract art were with the more mystically oriented of the major sources of abstractionist philosophy and practice, for instance the KandinskyKlee school. There have been no takers for Malevich's Suprematism, which militantly rejected both the artistic forms of the past and the world of appearances, privileging the new-minted geometric symbol as an autonomous sign of the desire for infinity.

Against this backdrop, we can identify three major abstractionist idioms in Indian art. The first develops from a love of the earth, and assumes the form of a celebration of the self's dissolution in the cosmic panorama; the landscape is no longer a realistic transcription of the scene, but is transformed into a visionary occasion for contemplating the cycles of decay and regeneration. The second idiom phrases its departures from symbolic and archetypal devices as invitations to heightened planes of awareness. Abstractionism begins with the establishment or dissolution of the motif, which can be drawn from diverse sources, including the hieroglyphic tablet, the Sufi meditation dance or the Tantric diagram. The third idiom is based on the lyric play of forms guided by gesture or allied with formal improvisations like the assemblage. Here, sometimes, the line dividing abstract image from patterned design or quasirandom expressive marking may blur. The flux of forms can also be regimented through the poetics of pure colour arrangements, vector-diagrammatic spaces and gestural design.

In this genealogy, some pure lines of descent follow their logic to the inevitable point of extinction, others engage in cross-fertilization, and yet others undergo mutation to maintain their energy. However, this genealogical survey demonstrates the wave at its crests, those points where the metaphysical and the painterly have been fused in images of abiding potency, ideas sensuously ordained rather than fabricated programmatically to a concept. It is equally possible to enumerate the thoughts where the two principles do not come together, thus arriving at a very different account. Uncharitable as it may sound, the history of Indian abstractionism records a series of attempts to avoid the risks of abstraction by resorting to an overt and near-generic symbolism, which many Indian abstractionists embrace when they find themselves bereft of the imaginative energy to negotiate the union of metaphysics and painterliness.

Such symbolism falls into a dual trap: it succumbs to the pompous vacuity of pure metaphysics when the burden of intention is passed off as justification; or then it is desiccated by the arid formalism of pure painterliness, with delight in the measure of chance or pattern guiding the execution of a painting. The ensuing conflict of purpose stalls the progress of abstractionism in an impasse. The remarkable Indian abstractionists are precisely those who have overcome this and addressed themselves to the basic elements of their art with a decisive sense of independence from prior models. In their recent work, we see the logic of Indian abstractionism pushed almost to the furthest it can be taken. Beyond such artists stands a lost generation of abstractionists whose work invokes a wistful, delicate beauty but stops there.

Abstractionism is not a universal language; it is an art that points up the loss of a shared language of signs in society. And yet, it affirms the possibility of its recovery through the effort of awareness. While its rhetoric has always emphasised a call for new forms of attention, abstractionist practice has tended to fall into a complacent pride in its own incomprehensibility; a complacency fatal in an ethos where vibrant new idioms compete for the viewers' attention. Indian abstractionists ought to

really return to basics, to reformulate and replenish their understanding of the nature of the relationship between the painted image and the world around it. But will they abandon their favourite conceptual habits and formal conventions, if this becomes necessary?

Which one of the following is not part of the author's characterisation of the conservative trend in Indian abstractionism?

A. An exploration of the subconscious mind.
B. A lack of full commitment to nonrepresentational symbols.
C. An adherence to the symbolic while aspiring to the mystical.
D. Usage of the images of gods or similar symbols.

## 5.16.8 Passage Reading: CAT 2000 | Question: 14 top

**The passage given below is followed by a question. Choose the best answer.**

One of the criteria by which we judge the vitality of a style of painting is its ability to renew itself- its responsiveness to the changing nature and quality of experience, the degree of conceptual and formal innovation that it exhibits. By this criterion, it would appear that the practice of abstractionism has failed to engage creatively with the radical change in human experience in recent decades. It has, seemingly, been unwilling to re-invent itself in relation to the systems of artistic expression and viewers' expectations that have developed under the impact of the mass media. The judgment that abstractionism has slipped into 'inertia gear' is gaining endorsement, not only among discerning viewers and practitioners of other art forms, but also among abstract painters themselves. Like their companions elsewhere in the world, abstractionists in India are asking themselves an overwhelming question today: Does abstractionism have a future? The major crisis that abstractionists face is that of revitalising their picture surface; few have improvised any solutions beyond the ones that were exhausted by the 1970s. Like all revolutions, whether in politics or in art, abstractionism must now confront its moment of truth: having begun life as a new and radical pictorial approach to experience, it has become an entrenched orthodoxy itself. Indeed, when viewed against a historical situation in which a variety of subversive, interactive and richly hybrid forms are available to the art practitioner, abstractionism assumes the remote and defiant air of an aristocracy that has outlived its age: trammelled by formulaic conventions yet buttressed by a rhetoric of sacred mystery, it seems condemned to being the last citadel of the self-regarding 'fine art' tradition, the last hurrah of painting for painting's sake.

The situation is further complicated in India by the circumstances in which an indigenous abstractionism came into prominence here during the 1960s. From the beginning it was propelled by the dialectic between two motives, one revolutionary and the other conservative-it was inaugurated as an act of emancipation from the dogmas of the nascent Indian nation state, when art was officially viewed as an indulgence at worst, and at best, as an instrument for the celebration of the republic's hopes and aspirations. Having rejected these dogmas, the pioneering abstractionists also went on to reject the various figurative styles associated with the Shantiniketan circle and others. In such a situation, abstractionism was a revolutionary move. It led art towards the exploration of the subconscious mind, the spiritual quest and the possible expansion of consciousness. Indian painting entered into a phase of self-inquiry, a meditative inner space where cosmic symbols and non-representational images ruled. Often, the transition from figurative idioms to abstractionist ones took place within the same artist.

At the same time, Indian abstractionists have rarely committed themselves wholeheartedly to a nonrepresentational idiom. They have been preoccupied with the fundamentally metaphysical project of aspiring to the mystical-holy without altogether renouncing the symbolic. This has been sustained by a hereditary reluctance to give up the murti, the inviolable iconic form, which explains why abstractionism is marked by the conservative tendency to operate with images from the sacred repertoire of the past. Abstractionism thus entered India as a double-edged device in a complex cultural transaction. Ideologically, it served as an internationalist legitimisation of the emerging revolutionary local trends. However, on entry, it was conscripted to serve local artistic preoccupations– a survey of indigenous abstractionism will show that its most obvious points of affinity with European and American abstract art were with the more mystically oriented of the major sources of abstractionist philosophy and practice, for instance the KandinskyKlee school. There have been no takers for Malevich's Suprematism, which militantly rejected both the artistic forms of the past and the world of appearances, privileging the new-minted geometric symbol as an autonomous sign of the desire for infinity.

Against this backdrop, we can identify three major abstractionist idioms in Indian art. The first develops from a love of the earth, and assumes the form of a celebration of the self's dissolution in the cosmic panorama; the landscape is no longer a realistic transcription of the scene, but is transformed into a visionary occasion for contemplating the cycles of decay and regeneration. The second idiom phrases its departures from symbolic and archetypal devices as invitations to heightened planes of awareness. Abstractionism begins with the establishment or dissolution of the motif, which can be drawn from diverse sources, including the hieroglyphic tablet, the Sufi meditation dance or the Tantric diagram. The third idiom is based on the lyric play of forms guided by gesture or allied with formal improvisations like the assemblage. Here, sometimes, the line dividing abstract image from patterned design or quasirandom expressive marking may blur. The flux of forms can also be regimented through the poetics of pure colour arrangements, vector-diagrammatic spaces and gestural design.

In this genealogy, some pure lines of descent follow their logic to the inevitable point of extinction, others engage in cross-fertilization, and yet others undergo mutation to maintain their energy. However, this genealogical survey demonstrates the wave at its crests, those points where the metaphysical and the painterly have been fused in images of abiding potency, ideas sensuously ordained rather than fabricated programmatically to a concept. It is equally possible to enumerate the thoughts where the two principles do not come together, thus arriving at a very different account. Uncharitable as it may sound, the

history of Indian abstractionism records a series of attempts to avoid the risks of abstraction by resorting to an overt and near-generic symbolism, which many Indian abstractionists embrace when they find themselves bereft of the imaginative energy to negotiate the union of metaphysics and painterliness.

Such symbolism falls into a dual trap: it succumbs to the pompous vacuity of pure metaphysics when the burden of intention is passed off as justification; or then it is desiccated by the arid formalism of pure painterliness, with delight in the measure of chance or pattern guiding the execution of a painting. The ensuing conflict of purpose stalls the progress of abstractionism in an impasse. The remarkable Indian abstractionists are precisely those who have overcome this and addressed themselves to the basic elements of their art with a decisive sense of independence from prior models. In their recent work, we see the logic of Indian abstractionism pushed almost to the furthest it can be taken. Beyond such artists stands a lost generation of abstractionists whose work invokes a wistful, delicate beauty but stops there.

Abstractionism is not a universal language; it is an art that points up the loss of a shared language of signs in society. And yet, it affirms the possibility of its recovery through the effort of awareness. While its rhetoric has always emphasised a call for new forms of attention, abstractionist practice has tended to fall into a complacent pride in its own incomprehensibility; a complacency fatal in an ethos where vibrant new idioms compete for the viewers' attention. Indian abstractionists ought to really return to basics, to reformulate and replenish their understanding of the nature of the relationship between the painted image and the world around it. But will they abandon their favourite conceptual habits and formal conventions, if this becomes necessary?

Given the author's delineation to the three abstractionist idioms in Indian art, the third idiom can be best distinguished from the other two idioms through its

A. depiction of nature's cyclical renewal.
B. use of non-representational images.
C. emphasis on arrangement of forms.
D. limited reliance on original models.

## 5.16.9 Passage Reading: CAT 2000 | Question: 15 top

**The passage given below is followed by a question. Choose the best answer.**

One of the criteria by which we judge the vitality of a style of painting is its ability to renew itself- its responsiveness to the changing nature and quality of experience, the degree of conceptual and formal innovation that it exhibits. By this criterion, it would appear that the practice of abstractionism has failed to engage creatively with the radical change in human experience in recent decades. It has, seemingly, been unwilling to re-invent itself in relation to the systems of artistic expression and viewers' expectations that have developed under the impact of the mass media. The judgment that abstractionism has slipped into 'inertia gear' is gaining endorsement, not only among discerning viewers and practitioners of other art forms, but also among abstract painters themselves. Like their companions elsewhere in the world, abstractionists in India are asking themselves an overwhelming question today: Does abstractionism have a future? The major crisis that abstractionists face is that of revitalising their picture surface; few have improvised any solutions beyond the ones that were exhausted by the 1970s. Like all revolutions, whether in politics or in art, abstractionism must now confront its moment of truth: having begun life as a new and radical pictorial approach to experience, it has become an entrenched orthodoxy itself. Indeed, when viewed against a historical situation in which a variety of subversive, interactive and richly hybrid forms are available to the art practitioner, abstractionism assumes the remote and defiant air of an aristocracy that has outlived its age: trammelled by formulaic conventions yet buttressed by a rhetoric of sacred mystery, it seems condemned to being the last citadel of the self-regarding 'fine art' tradition, the last hurrah of painting for painting's sake.

The situation is further complicated in India by the circumstances in which an indigenous abstractionism came into prominence here during the 1960s. From the beginning it was propelled by the dialectic between two motives, one revolutionary and the other conservative-it was inaugurated as an act of emancipation from the dogmas of the nascent Indian nation state, when art was officially viewed as an indulgence at worst, and at best, as an instrument for the celebration of the republic's hopes and aspirations. Having rejected these dogmas, the pioneering abstractionists also went on to reject the various figurative styles associated with the Shantiniketan circle and others. In such a situation, abstractionism was a revolutionary move. It led art towards the exploration of the subconscious mind, the spiritual quest and the possible expansion of consciousness. Indian painting entered into a phase of self-inquiry, a meditative inner space where cosmic symbols and non-representational images ruled. Often, the transition from figurative idioms to abstractionist ones took place within the same artist.

At the same time, Indian abstractionists have rarely committed themselves wholeheartedly to a nonrepresentational idiom. They have been preoccupied with the fundamentally metaphysical project of aspiring to the mystical-holy without altogether renouncing the symbolic. This has been sustained by a hereditary reluctance to give up the murti, the inviolable iconic form, which explains why abstractionism is marked by the conservative tendency to operate with images from the sacred repertoire of the past. Abstractionism thus entered India as a double-edged device in a complex cultural transaction. Ideologically, it served as an internationalist legitimisation of the emerging revolutionary local trends. However, on entry, it was conscripted to serve local artistic preoccupations– a survey of indigenous abstractionism will show that its most obvious points of affinity with European and American abstract art were with the more mystically oriented of the major sources of abstractionist philosophy and practice, for instance the KandinskyKlee school. There have been no takers for Malevich's Suprematism, which militantly rejected both the artistic forms of the past and the world of appearances, privileging the new-minted geometric symbol as an autonomous sign of the desire for infinity.

Against this backdrop, we can identify three major abstractionist idioms in Indian art. The first develops from a love of the

earth, and assumes the form of a celebration of the self's dissolution in the cosmic panorama; the landscape is no longer a realistic transcription of the scene, but is transformed into a visionary occasion for contemplating the cycles of decay and regeneration. The second idiom phrases its departures from symbolic and archetypal devices as invitations to heightened planes of awareness. Abstractionism begins with the establishment or dissolution of the motif, which can be drawn from diverse sources, including the hieroglyphic tablet, the Sufi meditation dance or the Tantric diagram. The third idiom is based on the lyric play of forms guided by gesture or allied with formal improvisations like the assemblage. Here, sometimes, the line dividing abstract image from patterned design or quasirandom expressive marking may blur. The flux of forms can also be regimented through the poetics of pure colour arrangements, vector-diagrammatic spaces and gestural design.

In this genealogy, some pure lines of descent follow their logic to the inevitable point of extinction, others engage in cross-fertilization, and yet others undergo mutation to maintain their energy. However, this genealogical survey demonstrates the wave at its crests, those points where the metaphysical and the painterly have been fused in images of abiding potency, ideas sensuously ordained rather than fabricated programmatically to a concept. It is equally possible to enumerate the thoughts where the two principles do not come together, thus arriving at a very different account. Uncharitable as it may sound, the history of Indian abstractionism records a series of attempts to avoid the risks of abstraction by resorting to an overt and near-generic symbolism, which many Indian abstractionists embrace when they find themselves bereft of the imaginative energy to negotiate the union of metaphysics and painterliness.

Such symbolism falls into a dual trap: it succumbs to the pompous vacuity of pure metaphysics when the burden of intention is passed off as justification; or then it is desiccated by the arid formalism of pure painterliness, with delight in the measure of chance or pattern guiding the execution of a painting. The ensuing conflict of purpose stalls the progress of abstractionism in an impasse. The remarkable Indian abstractionists are precisely those who have overcome this and addressed themselves to the basic elements of their art with a decisive sense of independence from prior models. In their recent work, we see the logic of Indian abstractionism pushed almost to the furthest it can be taken. Beyond such artists stands a lost generation of abstractionists whose work invokes a wistful, delicate beauty but stops there.

Abstractionism is not a universal language; it is an art that points up the loss of a shared language of signs in society. And yet, it affirms the possibility of its recovery through the effort of awareness. While its rhetoric has always emphasised a call for new forms of attention, abstractionist practice has tended to fall into a complacent pride in its own incomprehensibility; a complacency fatal in an ethos where vibrant new idioms compete for the viewers' attention. Indian abstractionists ought to really return to basics, to reformulate and replenish their understanding of the nature of the relationship between the painted image and the world around it. But will they abandon their favourite conceptual habits and formal conventions, if this becomes necessary?

According to the author, the attraction of the Kandinsky-Klee school for Indian abstractionist can be explained by which one of the following?

A. The conservative tendency to aspire to the mystical without a complete renunciation of the symbolic.
B. The discomfort of Indian abstractionists with Malevich's Suprematism.
C. The easy identification of obvious points of affinity with European and American abstract art, of which the Kandinsky-Klee school is an example.
D. The double-edged nature of abstractionism which enabled identification with mystically-oriented schools.

## 5.16.10 Passage Reading: CAT 2000 | Question: 16 top

**The passage given below is followed by a question. Choose the best answer.**

One of the criteria by which we judge the vitality of a style of painting is its ability to renew itself- its responsiveness to the changing nature and quality of experience, the degree of conceptual and formal innovation that it exhibits. By this criterion, it would appear that the practice of abstractionism has failed to engage creatively with the radical change in human experience in recent decades. It has, seemingly, been unwilling to re-invent itself in relation to the systems of artistic expression and viewers' expectations that have developed under the impact of the mass media. The judgment that abstractionism has slipped into 'inertia gear' is gaining endorsement, not only among discerning viewers and practitioners of other art forms, but also among abstract painters themselves. Like their companions elsewhere in the world, abstractionists in India are asking themselves an overwhelming question today: Does abstractionism have a future? The major crisis that abstractionists face is that of revitalising their picture surface; few have improvised any solutions beyond the ones that were exhausted by the 1970s. Like all revolutions, whether in politics or in art, abstractionism must now confront its moment of truth: having begun life as a new and radical pictorial approach to experience, it has become an entrenched orthodoxy itself. Indeed, when viewed against a historical situation in which a variety of subversive, interactive and richly hybrid forms are available to the art practitioner, abstractionism assumes the remote and defiant air of an aristocracy that has outlived its age: trammelled by formulaic conventions yet buttressed by a rhetoric of sacred mystery, it seems condemned to being the last citadel of the self-regarding 'fine art' tradition, the last hurrah of painting for painting's sake.

The situation is further complicated in India by the circumstances in which an indigenous abstractionism came into prominence here during the 1960s. From the beginning it was propelled by the dialectic between two motives, one revolutionary and the other conservative-it was inaugurated as an act of emancipation from the dogmas of the nascent Indian nation state, when art was officially viewed as an indulgence at worst, and at best, as an instrument for the celebration of the republic's hopes and

aspirations. Having rejected these dogmas, the pioneering abstractionists also went on to reject the various figurative styles associated with the Shantiniketan circle and others. In such a situation, abstractionism was a revolutionary move. It led art towards the exploration of the subconscious mind, the spiritual quest and the possible expansion of consciousness. Indian painting entered into a phase of self-inquiry, a meditative inner space where cosmic symbols and non-representational images ruled. Often, the transition from figurative idioms to abstractionist ones took place within the same artist.

At the same time, Indian abstractionists have rarely committed themselves wholeheartedly to a nonrepresentational idiom. They have been preoccupied with the fundamentally metaphysical project of aspiring to the mystical-holy without altogether renouncing the symbolic. This has been sustained by a hereditary reluctance to give up the murti, the inviolable iconic form, which explains why abstractionism is marked by the conservative tendency to operate with images from the sacred repertoire of the past. Abstractionism thus entered India as a double-edged device in a complex cultural transaction. Ideologically, it served as an internationalist legitimisation of the emerging revolutionary local trends. However, on entry, it was conscripted to serve local artistic preoccupations– a survey of indigenous abstractionism will show that its most obvious points of affinity with European and American abstract art were with the more mystically oriented of the major sources of abstractionist philosophy and practice, for instance the KandinskyKlee school. There have been no takers for Malevich's Suprematism, which militantly rejected both the artistic forms of the past and the world of appearances, privileging the new-minted geometric symbol as an autonomous sign of the desire for infinity.

Against this backdrop, we can identify three major abstractionist idioms in Indian art. The first develops from a love of the earth, and assumes the form of a celebration of the self's dissolution in the cosmic panorama; the landscape is no longer a realistic transcription of the scene, but is transformed into a visionary occasion for contemplating the cycles of decay and regeneration. The second idiom phrases its departures from symbolic and archetypal devices as invitations to heightened planes of awareness. Abstractionism begins with the establishment or dissolution of the motif, which can be drawn from diverse sources, including the hieroglyphic tablet, the Sufi meditation dance or the Tantric diagram. The third idiom is based on the lyric play of forms guided by gesture or allied with formal improvisations like the assemblage. Here, sometimes, the line dividing abstract image from patterned design or quasirandom expressive marking may blur. The flux of forms can also be regimented through the poetics of pure colour arrangements, vector-diagrammatic spaces and gestural design.

In this genealogy, some pure lines of descent follow their logic to the inevitable point of extinction, others engage in cross-fertilization, and yet others undergo mutation to maintain their energy. However, this genealogical survey demonstrates the wave at its crests, those points where the metaphysical and the painterly have been fused in images of abiding potency, ideas sensuously ordained rather than fabricated programmatically to a concept. It is equally possible to enumerate the thoughts where the two principles do not come together, thus arriving at a very different account. Uncharitable as it may sound, the history of Indian abstractionism records a series of attempts to avoid the risks of abstraction by resorting to an overt and near-generic symbolism, which many Indian abstractionists embrace when they find themselves bereft of the imaginative energy to negotiate the union of metaphysics and painterliness.

Such symbolism falls into a dual trap: it succumbs to the pompous vacuity of pure metaphysics when the burden of intention is passed off as justification; or then it is desiccated by the arid formalism of pure painterliness, with delight in the measure of chance or pattern guiding the execution of a painting. The ensuing conflict of purpose stalls the progress of abstractionism in an impasse. The remarkable Indian abstractionists are precisely those who have overcome this and addressed themselves to the basic elements of their art with a decisive sense of independence from prior models. In their recent work, we see the logic of Indian abstractionism pushed almost to the furthest it can be taken. Beyond such artists stands a lost generation of abstractionists whose work invokes a wistful, delicate beauty but stops there.

Abstractionism is not a universal language; it is an art that points up the loss of a shared language of signs in society. And yet, it affirms the possibility of its recovery through the effort of awareness. While its rhetoric has always emphasised a call for new forms of attention, abstractionist practice has tended to fall into a complacent pride in its own incomprehensibility; a complacency fatal in an ethos where vibrant new idioms compete for the viewers' attention. Indian abstractionists ought to really return to basics, to reformulate and replenish their understanding of the nature of the relationship between the painted image and the world around it. But will they abandon their favourite conceptual habits and formal conventions, if this becomes necessary?

Which one of the following, according to the author, is the most important reason for the stalling of abstractionism's progress in an impasse?

A. Some artists have followed their abstractionist logic to the point of extinction.
B. Some artists have allowed chance or pattern to dominate the execution of their paintings.
C. Many artists have avoided the trap of a neargeneric and an open symbolism.
D. Many artists have found it difficult to fuse the twin principles of the metaphysical and the painterly.

cat2000 verbal-ability passage-reading

## 5.16.11 Passage Reading: CAT 2000 | Question: 17 top

**The passage given below is followed by questions. Choose the best answer for each question.**

In a modern computer, electronic and magnetic storage technologies play complementary roles. Electronic memory chips are fast but volatile (their contents are lost when the computer is unplugged). Magnetic tapes and hard disks are slower, but have the advantage that they are non-volatile, so that they can be used to store software and documents even when the power is off.

In laboratories around the world, however, researchers are hoping to achieve the best of both worlds. They are trying to build magnetic memory chips that could be used in place of today's electronic ones. These magnetic memories would be nonvolatile; but they would also be faster, would consume less power, and would be able to stand up to hazardous environments more easily. Such chips would have obvious applications in storage cards for digital cameras and music-players; they would enable hand-held and laptop computers to boot up more quickly and to operate for longer; they would allow desktop computers to run faster; they would doubtless have military and space-faring advantages too. But although the theory behind them looks solid, there are tricky practical problems that need to be overcome.

In a modern computer, electronic and magnetic storage technologies play complementary roles. Electronic memory chips are fast but volatile (their contents are lost when the computer is unplugged). Magnetic tapes and hard disks are slower, but have the advantage that they are non-volatile, so that they can be used to store software and documents even when the power is off.

In laboratories around the world, however, researchers are hoping to achieve the best of both worlds. They are typing to build magnetic memory chips that could be used in place of today's electronic ones. These magnetic memories would be nonvolatile; but they would also be faster, would consume less power, and would be able to stand up to hazardous environments more easily. Such chips would have obvious applications in storage cards for digital cameras and music-players; they would enable hand-held and laptop computers to boot up more quickly and to operate for longer, they would allow desktop computers to run faster, they would doubtless have military and space-faring advantages too. But although the theory behind them looks solid, there are tricky practical problems that need to be overcome.

Two different approaches, based on different magnetic phenomena, are being pursued. The first, being investigated by Gary Prinz and his colleagues at the Naval Research Laboratory (NRL) in Washington, D.C., exploits the fact that the electrical resistance of some materials changes in the presence of a magnetic field- a phenomenon known as magneto-resistance. For some multi-layered materials this effect is particularly powerful and is, accordingly, called "giant" magneto-resistance (GMR). Since 1997, the exploitation of GMR has made cheap multi-gigabyte hard disks commonplace. The magnetic orientations of the magnetised spots on the surface of a spinning disk are detected by measuring the changes they induce in the resistance of a tiny sensor. This technique is so sensitive that it means the spots can be made smaller and packed closer together than was previously possible, thus increasing the capacity and reducing the size and cost of a disk drive.

Dr. Prinz and his colleagues are now exploiting the same phenomenon on the surface of memory chips, rather than spinning disks. In a conventional memory chip, each binary digit (bit) of data is represented using a capacitor-reservoir of electrical charge that is either empty or full-to represent a zero or a one. In the NRL's magnetic design, by contrast, each bit is stored in a magnetic element in the form of a vertical pillar of magnetisable material. A matrix of wires passing above and below the elements allows each to be magnetised, either clockwise or anti-clockwise, to represent zero or one. Another set of wires allows current to pass through any particular element. By measuring an element's resistance you can determine its magnetic orientation, and hence whether it is storing a zero or a one. Since the elements retain their magnetic orientation even when the power is off, the result is non-volatile memory. Unlike the elements of an electronic memory, a magnetic memory's elements are not easily disrupted by radiation. And compared with electronic memories, whose capacitors need constant topping up, magnetic memories are simpler and consume less power. The NRL researchers plan to commercialise their device through a company called Non-Volatile Electronics, which recently began work on the necessary processing and fabrication techniques. But it will be some years before the first chips roll off the production line.

Most attention in the field is focused on an alternative approach based on magnetic tunnel-junctions (MTJs), which are being investigated by researchers at chip makers such as IBM, Motorola, Siemens and HewlettPackard. IBM's research team, led by Stuart Parkin, has already created a 500-element working prototype that operates at 20 times the speed of conventional memory chips and consumes 1% of the power. Each element consists of a sandwich of two layers of magnetisable material separated by a barrier of aluminium oxide just four or five atoms thick. The polarisation of lower magnetisable layer is fixed in one direction, but that of the upper layer can be set (again, by passing a current through a matrix of control wires) either to the left or to the right, to store a zero or a one. The polarisations of the two layers are then in either the same or opposite directions.

Although the aluminium-oxide barrier is an electrical insulator, it is so thin that electrons are able to jump across it via a quantum-mechanical effect called tunnelling. It turns out that such tunnelling is easier when the two magnetic layers are polarised in the same direction than when they are polarised in opposite directions. So, by measuring the current that flows through the sandwich, it is possible to determine the alignment of the topmost layer, and hence whether it is storing a zero or a one.

To build a full-scale memory chip based on MTJs is, however, no easy matter. According to Paulo Freitas, an expert on chip manufacturing at the Technical University of Lisbon, magnetic memory elements will have to become far smaller and more reliable than current prototypes if they are to compete with electronic memory. At the same time, they will have to be sensitive enough to respond when the appropriate wires in the control matrix are switched on, but not so sensitive that they respond when a neighbouring element is changed. Despite these difficulties, the general consensus is that MTJs are the more promising ideas. Dr. Parkin says his group evaluated the GMR approach and decided not to pursue it, despite the fact that IBM pioneered GMR in hard disks. Dr. Prinz, however, contends that his plan will eventually offer higher storage densities and lower production costs.

Not content with shaking up the multi-billion-dollar market for computer memory, some researchers have even more ambitious

plans for magnetic computing. In a paper published last month in Science, Russell Cowburn and Mark Welland at Cambridge University outlined research that could form the basis of a magnetic microprocessor- a chip capable of manipulating (rather than merely storing) information magnetically. In place of conducting wires, a magnetic processor would have rows of magnetic dots, each of which could be polarised in one of two directions. Individual bits of information would travel down the rows as magnetic pulses, changing the orientation of the dots as they went. Dr. Cowburn and Dr. Welland have demonstrated how a logic gate (the basic element of a microprocessor) could work in such a scheme. In their experiment, they fed a signal in at one end of the chain of dots and used a second signal to control whether it propagated along the chain.

It is, admittedly, a long way from a single logic gate to a full microprocessor, but this was true also when the transistor was first invented. Dr. Cowburn, who is now searching for backers to help commercialise the technology, says he believes it will be at least ten years before the first magnetic microprocessor is constructed. But other researchers in the field agree that such a chip is the next logical step. Dr. Prinz says that once magnetic memory is sorted out "the target is to go after the logic circuits." Whether all-magnetic computers will ever be able to compete with other contenders that are jostling to knock electronics off its perch-such as optical, biological and quantum computing-remains to be seen. Dr. Cowburn suggests that the future lies with hybrid machines that use different technologies. But computing with magnetism evidently has an attraction all its own.

In developing magnetic memory chips to replace the electronic ones, two alternative research paths are being pursued. These are approaches based on

A. volatile and non-volatile memories.
B. magneto-resistance and magnetic tunneljunctions.
C. radiation-disruption and radiation-neutral effects.
D. orientation of magnetised spots on the surface of a spinning disk and alignment of magnetic dots on the surface of a conventional memory chip.

## 5.16.12 Passage Reading: CAT 2000 | Question: 18 top

**The passage given below is followed by questions. Choose the best answer for each question.**

In a modern computer, electronic and magnetic storage technologies play complementary roles. Electronic memory chips are fast but volatile (their contents are lost when the computer is unplugged). Magnetic tapes and hard disks are slower, but have the advantage that they are non-volatile, so that they can be used to store software and documents even when the power is off.

In laboratories around the world, however, researchers are hoping to achieve the best of both worlds. They are trying to build magnetic memory chips that could be used in place of today's electronic ones. These magnetic memories would be nonvolatile; but they would also be faster, would consume less power, and would be able to stand up to hazardous environments more easily. Such chips would have obvious applications in storage cards for digital cameras and music-players; they would enable hand-held and laptop computers to boot up more quickly and to operate for longer; they would allow desktop computers to run faster; they would doubtless have military and space-faring advantages too. But although the theory behind them looks solid, there are tricky practical problems that need to be overcome.

Two different approaches, based on different magnetic phenomena, are being pursued. The first, being investigated by Gary Prinz and his colleagues at the Naval Research Laboratory (NRL) in Washington, D.C., exploits the fact that the electrical resistance of some materials changes in the presence of a magnetic field- a phenomenon known as magneto-resistance. For some multi-layered materials this effect is particularly powerful and is, accordingly, called "giant" magneto-resistance (GMR). Since 1997, the exploitation of GMR has made cheap multi-gigabyte hard disks commonplace. The magnetic orientations of the magnetised spots on the surface of a spinning disk are detected by measuring the changes they induce in the resistance of a tiny sensor. This technique is so sensitive that it means the spots can be made smaller and packed closer together than was previously possible, thus increasing the capacity and reducing the size and cost of a disk drive.

Dr. Prinz and his colleagues are now exploiting the same phenomenon on the surface of memory chips, rather than spinning disks. In a conventional memory chip, each binary digit (bit) of data is represented using a capacitor-reservoir of electrical charge that is either empty or full-to represent a zero or a one. In the NRL's magnetic design, by contrast, each bit is stored in a magnetic element in the form of a vertical pillar of magnetisable material. A matrix of wires passing above and below the elements allows each to be magnetised, either clockwise or anti-clockwise, to represent zero or one. Another set of wires allows current to pass through any particular element. By measuring an element's resistance you can determine its magnetic orientation, and hence whether it is storing a zero or a one. Since the elements retain their magnetic orientation even when the power is off, the result is non-volatile memory. Unlike the elements of an electronic memory, a magnetic memory's elements are not easily disrupted by radiation. And compared with electronic memories, whose capacitors need constant topping up, magnetic memories are simpler and consume less power. The NRL researchers plan to commercialise their device through a company called Non-Volatile Electronics, which recently began work on the necessary processing and fabrication techniques. But it will be some years before the first chips roll off the production line.

Most attention in the field is focused on an alternative approach based on magnetic tunnel-junctions (MTJs), which are being investigated by researchers at chip makers such as IBM, Motorola, Siemens and HewlettPackard. IBM's research team, led by Stuart Parkin, has already created a 500-element working prototype that operates at 20 times the speed of conventional memory chips and consumes 1% of the power. Each element consists of a sandwich of two layers of magnetisable material separated by a barrier of aluminium oxide just four or five atoms thick. The polarisation of lower magnetisable layer is fixed in one

direction, but that of the upper layer can be set (again, by passing a current through a matrix of control wires) either to the left or to the right, to store a zero or a one. The polarisations of the two layers are then in either the same or opposite directions.

Although the aluminium-oxide barrier is an electrical insulator, it is so thin that electrons are able to jump across it via a quantum-mechanical effect called tunnelling. It turns out that such tunnelling is easier when the two magnetic layers are polarised in the same direction than when they are polarised in opposite directions. So, by measuring the current that flows through the sandwich, it is possible to determine the alignment of the topmost layer, and hence whether it is storing a zero or a one.

To build a full-scale memory chip based on MTJs is, however, no easy matter. According to Paulo Freitas, an expert on chip manufacturing at the Technical University of Lisbon, magnetic memory elements will have to become far smaller and more reliable than current prototypes if they are to compete with electronic memory. At the same time, they will have to be sensitive enough to respond when the appropriate wires in the control matrix are switched on, but not so sensitive that they respond when a neighbouring element is changed. Despite these difficulties, the general consensus is that MTJs are the more promising ideas. Dr. Parkin says his group evaluated the GMR approach and decided not to pursue it, despite the fact that IBM pioneered GMR in hard disks. Dr. Prinz, however, contends that his plan will eventually offer higher storage densities and lower production costs.

Not content with shaking up the multi-billion-dollar market for computer memory, some researchers have even more ambitious plans for magnetic computing. In a paper published last month in Science, Russell Cowburn and Mark Welland at Cambridge University outlined research that could form the basis of a magnetic microprocessor- a chip capable of manipulating (rather than merely storing) information magnetically. In place of conducting wires, a magnetic processor would have rows of magnetic dots, each of which could be polarised in one of two directions. Individual bits of information would travel down the rows as magnetic pulses, changing the orientation of the dots as they went. Dr. Cowburn and Dr. Welland have demonstrated how a logic gate (the basic element of a microprocessor) could work in such a scheme. In their experiment, they fed a signal in at one end of the chain of dots and used a second signal to control whether it propagated along the chain.

It is, admittedly, a long way from a single logic gate to a full microprocessor, but this was true also when the transistor was first invented. Dr. Cowburn, who is now searching for backers to help commercialise the technology, says he believes it will be at least ten years before the first magnetic microprocessor is constructed. But other researchers in the field agree that such a chip is the next logical step. Dr. Prinz says that once magnetic memory is sorted out “the target is to go after the logic circuits.” Whether all-magnetic computers will ever be able to compete with other contenders that are jostling to knock electronics off its perch-such as optical, biological and quantum computing-remains to be seen. Dr. Cowburn suggests that the future lies with hybrid machines that use different technologies. But computing with magnetism evidently has an attraction all its own.

A binary digit or bit is represented in the magneto-resistance based magnetic chip using

A. a layer of aluminium oxide.
B. a capacitor.
C. a vertical pillar of magnetised material.
D. a matrix of wires.

cat2000 verbal-ability passage-reading

## 5.16.13 Passage Reading: CAT 2000 | Question: 19 top

**The passage given below is followed by questions. Choose the best answer for each question.**

In a modern computer, electronic and magnetic storage technologies play complementary roles. Electronic memory chips are fast but volatile (their contents are lost when the computer is unplugged). Magnetic tapes and hard disks are slower, but have the advantage that they are non-volatile, so that they can be used to store software and documents even when the power is off.

In laboratories around the world, however, researchers are hoping to achieve the best of both worlds. They are trying to build magnetic memory chips that could be used in place of today's electronic ones. These magnetic memories would be nonvolatile; but they would also be faster, would consume less power, and would be able to stand up to hazardous environments more easily. Such chips would have obvious applications in storage cards for digital cameras and music-players; they would enable hand-held and laptop computers to boot up more quickly and to operate for longer; they would allow desktop computers to run faster; they would doubtless have military and space-faring advantages too. But although the theory behind them looks solid, there are tricky practical problems that need to be overcome.

Two different approaches, based on different magnetic phenomena, are being pursued. The first, being investigated by Gary Prinz and his colleagues at the Naval Research Laboratory (NRL) in Washington, D.C., exploits the fact that the electrical resistance of some materials changes in the presence of a magnetic field- a phenomenon known as magneto-resistance. For some multi-layered materials this effect is particularly powerful and is, accordingly, called “giant” magneto-resistance (GMR). Since 1997, the exploitation of GMR has made cheap multi-gigabyte hard disks commonplace. The magnetic orientations of the magnetised spots on the surface of a spinning disk are detected by measuring the changes they induce in the resistance of a tiny sensor. This technique is so sensitive that it means the spots can be made smaller and packed closer together than was previously possible, thus increasing the capacity and reducing the size and cost of a disk drive.

Dr. Prinz and his colleagues are now exploiting the same phenomenon on the surface of memory chips, rather than spinning disks. In a conventional memory chip, each binary digit (bit) of data is represented using a capacitor-reservoir of electrical charge that is either empty or full-to represent a zero or a one. In the NRL’s magnetic design, by contrast, each bit is stored in a magnetic element in the form of a vertical pillar of magnetisable material. A matrix of wires passing above and below the elements allows each to be magnetised, either clockwise or anti-clockwise, to represent zero or one. Another set of wires allows

current to pass through any particular element. By measuring an element's resistance you can determine its magnetic orientation, and hence whether it is storing a zero or a one. Since the elements retain their magnetic orientation even when the power is off, the result is non-volatile memory. Unlike the elements of an electronic memory, a magnetic memory's elements are not easily disrupted by radiation. And compared with electronic memories, whose capacitors need constant topping up, magnetic memories are simpler and consume less power. The NRL researchers plan to commercialise their device through a company called Non-Volatile Electronics, which recently began work on the necessary processing and fabrication techniques. But it will be some years before the first chips roll off the production line.

Most attention in the field is focused on an alternative approach based on magnetic tunnel-junctions (MTJs), which are being investigated by researchers at chip makers such as IBM, Motorola, Siemens and HewlettPackard. IBM's research team, led by Stuart Parkin, has already created a 500-element working prototype that operates at 20 times the speed of conventional memory chips and consumes 1% of the power. Each element consists of a sandwich of two layers of magnetisable material separated by a barrier of aluminium oxide just four or five atoms thick. The polarisation of lower magnetisable layer is fixed in one direction, but that of the upper layer can be set (again, by passing a current through a matrix of control wires) either to the left or to the right, to store a zero or a one. The polarisations of the two layers are then in either the same or opposite directions.

Although the aluminium-oxide barrier is an electrical insulator, it is so thin that electrons are able to jump across it via a quantum-mechanical effect called tunnelling. It turns out that such tunnelling is easier when the two magnetic layers are polarised in the same direction than when they are polarised in opposite directions. So, by measuring the current that flows through the sandwich, it is possible to determine the alignment of the topmost layer, and hence whether it is storing a zero or a one.

To build a full-scale memory chip based on MTJs is, however, no easy matter. According to Paulo Freitas, an expert on chip manufacturing at the Technical University of Lisbon, magnetic memory elements will have to become far smaller and more reliable than current prototypes if they are to compete with electronic memory. At the same time, they will have to be sensitive enough to respond when the appropriate wires in the control matrix are switched on, but not so sensitive that they respond when a neighbouring element is changed. Despite these difficulties, the general consensus is that MTJs are the more promising ideas. Dr. Parkin says his group evaluated the GMR approach and decided not to pursue it, despite the fact that IBM pioneered GMR in hard disks. Dr. Prinz, however, contends that his plan will eventually offer higher storage densities and lower production costs.

Not content with shaking up the multi-billion-dollar market for computer memory, some researchers have even more ambitious plans for magnetic computing. In a paper published last month in Science, Russell Cowburn and Mark Welland at Cambridge University outlined research that could form the basis of a magnetic microprocessor- a chip capable of manipulating (rather than merely storing) information magnetically. In place of conducting wires, a magnetic processor would have rows of magnetic dots, each of which could be polarised in one of two directions. Individual bits of information would travel down the rows as magnetic pulses, changing the orientation of the dots as they went. Dr. Cowburn and Dr. Welland have demonstrated how a logic gate (the basic element of a microprocessor) could work in such a scheme. In their experiment, they fed a signal in at one end of the chain of dots and used a second signal to control whether it propagated along the chain.

It is, admittedly, a long way from a single logic gate to a full microprocessor, but this was true also when the transistor was first invented. Dr. Cowburn, who is now searching for backers to help commercialise the technology, says he believes it will be at least ten years before the first magnetic microprocessor is constructed. But other researchers in the field agree that such a chip is the next logical step. Dr. Prinz says that once magnetic memory is sorted out "the target is to go after the logic circuits." Whether all-magnetic computers will ever be able to compete with other contenders that are jostling to knock electronics off its perch-such as optical, biological and quantum computing-remains to be seen. Dr. Cowburn suggests that the future lies with hybrid machines that use different technologies. But computing with magnetism evidently has an attraction all its own.

In the magnetic tunnel-junctions (MTJs) tunnelling is easier when

A. two magnetic layers are polarised in the same direction.
B. two magnetic layers are polarised in the opposite directions.
C. two aluminium-oxide barriers are polarised in the same direction.
D. two aluminium-oxide barriers are polarised in opposite directions

cat2000 verbal-ability passage-reading

## 5.16.14 Passage Reading: CAT 2000 | Question: 2 top

**The passage given below is followed by a question. Choose the best answer.**

The current debate on intellectual property rights (IPRs) raises a number of important issues concerning the strategy and policies for building a more dynamic national agricultural research system, the relative roles of public and private sectors, and the role of agribusiness multinational corporations (MNCs). This debate has been stimulated by the international agreement on Trade Related Intellectual Property Rights (TRIPs), negotiated as part of the Uruguay Round. TRIPs, for the first time, seeks to bring innovations in agricultural technology under a new worldwide IPR regime. The agribusiness MNCs (along with pharmaceutical companies) played a leading part in lobbying for such a regime during the Uruguay Round negotiations. The argument was that incentives are necessary to stimulate innovations, and that this calls for a system of patents which gives innovators the sole right to use (or sell/lease the right to use) their innovations for a specified period and protects them against unauthorised copying or use. With strong support of their national governments, they were influential in shaping the agreement on TRIPs, which eventually emerged from the Uruguay Round.

The current debate on TRIPs in India- as indeed elsewhere- echoes wider concerns about 'privatisation' of research and allowing a free field for MNCs in the sphere of biotechnology and agriculture. The agribusiness corporations, and those with unbounded faith in the power of science to overcome all likely problems, point to the vast potential that new technology holds for solving the problems of hunger, malnutrition and poverty in the world. The exploitation of this potential should be encouraged and this is best done by the private sector for which patents are essential. Some, who do not necessarily accept this optimism, argue that fears of MNC domination are exaggerated and that farmers will accept their products only if they decisively outperform the available alternatives. Those who argue against agreeing to introduce an IPR regime in agriculture and encouraging private sector research are apprehensive that this will work to the disadvantage of farmers by making them more and more dependent on monopolistic MNCs. A different, though related apprehension is that extensive use of hybrids and genetically engineered new varieties might increase the vulnerability of agriculture to outbreaks of pests and diseases. The larger, longer-term consequences of reduced biodiversity that may follow from the use of specially bred varieties are also another cause for concern. Moreover, corporations, driven by the profit motive, will necessarily tend to underplay, if not ignore, potential adverse consequences, especially those which are unknown and which may manifest themselves only over a relatively long period. On the other hand, high pressure advertising and aggressive sales campaigns by private companies can seduce farmers into accepting varieties without being aware of potential adverse effects and the possibility of disastrous consequences for their livelihood if these varieties happen to fail. There is no provision under the laws, as they now exist, for compensating users against such eventualities.

Excessive preoccupation with seeds and seed material has obscured other important issues involved in reviewing the research policy. We need to remind ourselves that improved varieties by themselves are not sufficient for sustained growth of yields. In our own experience, some of the early high yielding varieties (HYVs) of rice and wheat were found susceptible to widespread pest attacks; and some had problems of grain quality. Further research was necessary to solve these problems. This largely successful research was almost entirely done in public research institutions. Of course, it could in principle have been done by private companies, but whether they choose to do so depends crucially on the extent of the loss in market for their original introductions on account of the above factors and whether the companies are financially strong enough to absorb the 'losses', invest in research to correct the deficiencies and recover the lost market. Public research, which is not driven by profit, is better placed to take corrective action. Research for improving common pool resource management, maintaining ecological health and ensuring sustainability is both critical and also demanding in terms of technological challenge and resource requirements. As such research is crucial to the impact of new varieties, chemicals and equipment in the farmer's field, private companies should be interested in such research. But their primary interest is in the sale of seed material, chemicals, equipment and other inputs produced by them. Knowledge and techniques for resource management are not 'marketable' in the same way as those inputs. Their application to land, water and forests has a long gestation and their efficacy depends on resolving difficult problems such as designing institutions for proper and equitable management of common pool resources. Public or quasi-public research institutions informed by broader, long-term concerns can only do such work.

The public sector must therefore continue to play a major role in the national research system. It is both wrong and misleading to pose the problem in terms of public sector versus private sector or of privatisation of research. We need to address problems likely to arise on account of the publicprivatesector complementarily, and ensure that the public research system performs efficiently. Complementarily between various elements of research raises several issues in implementing an IPR regime. Private companies do not produce new varieties and inputs entirely as a result of their own research. Almost all technological improvement is based on knowledge and experience accumulated from the past, and the results of basic and applied research in public and quasi-public institutions (universities, research organisations). Moreover, as is increasingly recognised, accumulated stock of knowledge does not reside only in the scientific community and its academic publications, but is also widely diffused in traditions and folk knowledge of local communities all over.

The deciphering of the structure and functioning of DNA forms the basis of much of modern biotechnology. But this fundamental breakthrough is a 'public good' freely accessible in the public domain and usable free of any charge. Varieties/techniques developed using that knowledge can however be, and are, patented for private profit. Similarly, private corporations draw extensively, and without any charge, on germ plasm available in varieties of plants species (neem and turmeric are by now famous examples). Publicly funded gene banks as well as new varieties bred by public sector research stations can also be used freely by private enterprises for developing their own varieties and seek patent protection for them. Should private breeders be allowed free use of basic scientific discoveries? Should the repositories of traditional knowledge and germ plasm be collected which are maintained and improved by publicly funded institutions? Or should users be made to pay for such use? If they are to pay, what should be the basis of compensation? Should the compensation be for individuals or for communities/institutions to which they belong? Should individuals/ institutions be given the right of patenting their innovations? These are some of the important issues that deserve more attention than they now get and need serious detailed

study to evolve reasonably satisfactory, fair and workable solutions. Finally, the tendency to equate the public sector with the government is wrong. The public space is much wider than government departments and includes co-operatives, universities, public trust and a variety of non-governmental organizations (NGOs). Giving greater autonomy to research organizations from government control and giving non-government public institutions the space and resources to play a larger, more effective role in research, is therefore an issue of direct relevance in restructuring the public research system.

The fundamental breakthrough in deciphering the structure and functioning of DNA has become a public good. This means that

A. breakthroughs in fundamental research on DNA are accessible by all without any monetary considerations.
B. the fundamental research on DNA has the characteristic of having beneficial effects for the public at large.
C. due to the large scale of fundamental research on DNA, it falls in the domain of public sector research institutions.
D. the public and other companies must have free access to such fundamental breakthroughs in research.

cat2000 verbal-ability passage-reading

## 5.16.15 Passage Reading: CAT 2000 | Question: 20 top

**The passage given below is followed by questions. Choose the best answer for each question.**

In a modern computer, electronic and magnetic storage technologies play complementary roles. Electronic memory chips are fast but volatile (their contents are lost when the computer is unplugged). Magnetic tapes and hard disks are slower, but have the advantage that they are non-volatile, so that they can be used to store software and documents even when the power is off.

In laboratories around the world, however, researchers are hoping to achieve the best of both worlds. They are trying to build magnetic memory chips that could be used in place of today's electronic ones. These magnetic memories would be nonvolatile; but they would also be faster, would consume less power, and would be able to stand up to hazardous environments more easily. Such chips would have obvious applications in storage cards for digital cameras and music-players; they would enable hand-held and laptop computers to boot up more quickly and to operate for longer; they would allow desktop computers to run faster; they would doubtless have military and space-faring advantages too. But although the theory behind them looks solid, there are tricky practical problems that need to be overcome.

Two different approaches, based on different magnetic phenomena, are being pursued. The first, being investigated by Gary Prinz and his colleagues at the Naval Research Laboratory (NRL) in Washington, D.C., exploits the fact that the electrical resistance of some materials changes in the presence of a magnetic field- a phenomenon known as magneto-resistance. For some multi-layered materials this effect is particularly powerful and is, accordingly, called "giant" magneto-resistance (GMR). Since 1997, the exploitation of GMR has made cheap multi-gigabyte hard disks commonplace. The magnetic orientations of the magnetised spots on the surface of a spinning disk are detected by measuring the changes they induce in the resistance of a tiny sensor. This technique is so sensitive that it means the spots can be made smaller and packed closer together than was previously possible, thus increasing the capacity and reducing the size and cost of a disk drive.

Dr. Prinz and his colleagues are now exploiting the same phenomenon on the surface of memory chips, rather than spinning disks. In a conventional memory chip, each binary digit (bit) of data is represented using a capacitor-reservoir of electrical charge that is either empty or full-to represent a zero or a one. In the NRL's magnetic design, by contrast, each bit is stored in a magnetic element in the form of a vertical pillar of magnetisable material. A matrix of wires passing above and below the elements allows each to be magnetised, either clockwise or anti-clockwise, to represent zero or one. Another set of wires allows current to pass through any particular element. By measuring an element's resistance you can determine its magnetic orientation, and hence whether it is storing a zero or a one. Since the elements retain their magnetic orientation even when the power is off, the result is non-volatile memory. Unlike the elements of an electronic memory, a magnetic memory's elements are not easily disrupted by radiation. And compared with electronic memories, whose capacitors need constant topping up, magnetic memories are simpler and consume less power. The NRL researchers plan to commercialise their device through a company called Non-Volatile Electronics, which recently began work on the necessary processing and fabrication techniques. But it will be some years before the first chips roll off the production line.

Most attention in the field is focused on an alternative approach based on magnetic tunnel-junctions (MTJs), which are being investigated by researchers at chip makers such as IBM, Motorola, Siemens and HewlettPackard. IBM's research team, led by Stuart Parkin, has already created a $500-$ element working prototype that operates at 20 times the speed of conventional memory chips and consumes 1% of the power. Each element consists of a sandwich of two layers of magnetisable material separated by a barrier of aluminium oxide just four or five atoms thick. The polarisation of lower magnetisable layer is fixed in one direction, but that of the upper layer can be set (again, by passing a current through a matrix of control wires) either to the left or to the right, to store a zero or a one. The polarisations of the two layers are then in either the same or opposite directions.

Although the aluminium-oxide barrier is an electrical insulator, it is so thin that electrons are able to jump across it via a quantum-mechanical effect called tunnelling. It turns out that such tunnelling is easier when the two magnetic layers are polarised in the same direction than when they are polarised in opposite directions. So, by measuring the current that flows through the sandwich, it is possible to determine the alignment of the topmost layer, and hence whether it is storing a zero or a one.

To build a full-scale memory chip based on MTJs is, however, no easy matter. According to Paulo Freitas, an expert on chip manufacturing at the Technical University of Lisbon, magnetic memory elements will have to become far smaller and more reliable than current prototypes if they are to compete with electronic memory. At the same time, they will have to be sensitive

enough to respond when the appropriate wires in the control matrix are switched on, but not so sensitive that they respond when a neighbouring element is changed. Despite these difficulties, the general consensus is that MTJs are the more promising ideas. Dr. Parkin says his group evaluated the GMR approach and decided not to pursue it, despite the fact that IBM pioneered GMR in hard disks. Dr. Prinz, however, contends that his plan will eventually offer higher storage densities and lower production costs.

Not content with shaking up the multi-billion-dollar market for computer memory, some researchers have even more ambitious plans for magnetic computing. In a paper published last month in Science, Russell Cowburn and Mark Welland at Cambridge University outlined research that could form the basis of a magnetic microprocessor- a chip capable of manipulating (rather than merely storing) information magnetically. In place of conducting wires, a magnetic processor would have rows of magnetic dots, each of which could be polarised in one of two directions. Individual bits of information would travel down the rows as magnetic pulses, changing the orientation of the dots as they went. Dr. Cowburn and Dr. Welland have demonstrated how a logic gate (the basic element of a microprocessor) could work in such a scheme. In their experiment, they fed a signal in at one end of the chain of dots and used a second signal to control whether it propagated along the chain.

It is, admittedly, a long way from a single logic gate to a full microprocessor, but this was true also when the transistor was first invented. Dr. Cowburn, who is now searching for backers to help commercialise the technology, says he believes it will be at least ten years before the first magnetic microprocessor is constructed. But other researchers in the field agree that such a chip is the next logical step. Dr. Prinz says that once magnetic memory is sorted out "the target is to go after the logic circuits." Whether all-magnetic computers will ever be able to compete with other contenders that are jostling to knock electronics off its perch-such as optical, biological and quantum computing-remains to be seen. Dr. Cowburn suggests that the future lies with hybrid machines that use different technologies. But computing with magnetism evidently has an attraction all its own.

A major barrier on the way to build a full-scale memory chip based on MTJs is

A. the low sensitivity of the magnetic memory elements.
B. the thickness of aluminium oxide barriers.
C. the need to develop more reliable and far smaller magnetic memory chips.
D. all of the above.

cat2000 verbal-ability passage-reading

## 5.16.16 Passage Reading: CAT 2000 | Question: 21 top

**The passage given below is followed by questions. Choose the best answer for each question.**

In a modern computer, electronic and magnetic storage technologies play complementary roles. Electronic memory chips are fast but volatile (their contents are lost when the computer is unplugged). Magnetic tapes and hard disks are slower, but have the advantage that they are non-volatile, so that they can be used to store software and documents even when the power is off.

In laboratories around the world, however, researchers are hoping to achieve the best of both worlds. They are trying to build magnetic memory chips that could be used in place of today's electronic ones. These magnetic memories would be nonvolatile; but they would also be faster, would consume less power, and would be able to stand up to hazardous environments more easily. Such chips would have obvious applications in storage cards for digital cameras and music-players; they would enable hand-held and laptop computers to boot up more quickly and to operate for longer; they would allow desktop computers to run faster; they would doubtless have military and space-faring advantages too. But although the theory behind them looks solid, there are tricky practical problems that need to be overcome.

Two different approaches, based on different magnetic phenomena, are being pursued. The first, being investigated by Gary Prinz and his colleagues at the Naval Research Laboratory (NRL) in Washington, D.C., exploits the fact that the electrical resistance of some materials changes in the presence of a magnetic field- a phenomenon known as magneto-resistance. For some multi-layered materials this effect is particularly powerful and is, accordingly, called "giant" magneto-resistance (GMR). Since 1997, the exploitation of GMR has made cheap multi-gigabyte hard disks commonplace. The magnetic orientations of the magnetised spots on the surface of a spinning disk are detected by measuring the changes they induce in the resistance of a tiny sensor. This technique is so sensitive that it means the spots can be made smaller and packed closer together than was previously possible, thus increasing the capacity and reducing the size and cost of a disk drive.

Dr. Prinz and his colleagues are now exploiting the same phenomenon on the surface of memory chips, rather than spinning disks. In a conventional memory chip, each binary digit (bit) of data is represented using a capacitor-reservoir of electrical charge that is either empty or full-to represent a zero or a one. In the NRL's magnetic design, by contrast, each bit is stored in a magnetic element in the form of a vertical pillar of magnetisable material. A matrix of wires passing above and below the elements allows each to be magnetised, either clockwise or anti-clockwise, to represent zero or one. Another set of wires allows current to pass through any particular element. By measuring an element's resistance you can determine its magnetic orientation, and hence whether it is storing a zero or a one. Since the elements retain their magnetic orientation even when the power is off, the result is non-volatile memory. Unlike the elements of an electronic memory, a magnetic memory's elements are not easily disrupted by radiation. And compared with electronic memories, whose capacitors need constant topping up, magnetic memories are simpler and consume less power. The NRL researchers plan to commercialise their device through a company called Non-Volatile Electronics, which recently began work on the necessary processing and fabrication techniques. But it will be some years before the first chips roll off the production line.

Most attention in the field is focused on an alternative approach based on magnetic tunnel-junctions (MTJs), which are being

investigated by researchers at chip makers such as IBM, Motorola, Siemens and HewlettPackard. IBM's research team, led by Stuart Parkin, has already created a 500-element working prototype that operates at 20 times the speed of conventional memory chips and consumes 1% of the power. Each element consists of a sandwich of two layers of magnetisable material separated by a barrier of aluminium oxide just four or five atoms thick. The polarisation of lower magnetisable layer is fixed in one direction, but that of the upper layer can be set (again, by passing a current through a matrix of control wires) either to the left or to the right, to store a zero or a one. The polarisations of the two layers are then in either the same or opposite directions.

Although the aluminium-oxide barrier is an electrical insulator, it is so thin that electrons are able to jump across it via a quantum-mechanical effect called tunnelling. It turns out that such tunnelling is easier when the two magnetic layers are polarised in the same direction than when they are polarised in opposite directions. So, by measuring the current that flows through the sandwich, it is possible to determine the alignment of the topmost layer, and hence whether it is storing a zero or a one.

To build a full-scale memory chip based on MTJs is, however, no easy matter. According to Paulo Freitas, an expert on chip manufacturing at the Technical University of Lisbon, magnetic memory elements will have to become far smaller and more reliable than current prototypes if they are to compete with electronic memory. At the same time, they will have to be sensitive enough to respond when the appropriate wires in the control matrix are switched on, but not so sensitive that they respond when a neighbouring element is changed. Despite these difficulties, the general consensus is that MTJs are the more promising ideas. Dr. Parkin says his group evaluated the GMR approach and decided not to pursue it, despite the fact that IBM pioneered GMR in hard disks. Dr. Prinz, however, contends that his plan will eventually offer higher storage densities and lower production costs.

Not content with shaking up the multi-billion-dollar market for computer memory, some researchers have even more ambitious plans for magnetic computing. In a paper published last month in Science, Russell Cowburn and Mark Welland at Cambridge University outlined research that could form the basis of a magnetic microprocessor- a chip capable of manipulating (rather than merely storing) information magnetically. In place of conducting wires, a magnetic processor would have rows of magnetic dots, each of which could be polarised in one of two directions. Individual bits of information would travel down the rows as magnetic pulses, changing the orientation of the dots as they went. Dr. Cowburn and Dr. Welland have demonstrated how a logic gate (the basic element of a microprocessor) could work in such a scheme. In their experiment, they fed a signal in at one end of the chain of dots and used a second signal to control whether it propagated along the chain.

It is, admittedly, a long way from a single logic gate to a full microprocessor, but this was true also when the transistor was first invented. Dr. Cowburn, who is now searching for backers to help commercialise the technology, says he believes it will be at least ten years before the first magnetic microprocessor is constructed. But other researchers in the field agree that such a chip is the next logical step. Dr. Prinz says that once magnetic memory is sorted out "the target is to go after the logic circuits." Whether all-magnetic computers will ever be able to compete with other contenders that are jostling to knock electronics off its perch-such as optical, biological and quantum computing-remains to be seen. Dr. Cowburn suggests that the future lies with hybrid machines that use different technologies. But computing with magnetism evidently has an attraction all its own.

In the MTJs approach, it is possible to identify whether the topmost layer of the magnetised memory element is storing a zero or one by

A. measuring an element's resistance and thus determining its magnetic orientation.
B. measuring the degree of disruption caused by radiation in the elements of the magnetic memory.
C. magnetising the elements either clockwise or anti-clockwise.
D. measuring the current that flows through the sandwich.

## 5.16.17 Passage Reading: CAT 2000 | Question: 22 top

**The passage given below is followed by questions. Choose the best answer for each question.**

In a modern computer, electronic and magnetic storage technologies play complementary roles. Electronic memory chips are fast but volatile (their contents are lost when the computer is unplugged). Magnetic tapes and hard disks are slower, but have the advantage that they are non-volatile, so that they can be used to store software and documents even when the power is off.

In laboratories around the world, however, researchers are hoping to achieve the best of both worlds. They are trying to build magnetic memory chips that could be used in place of today's electronic ones. These magnetic memories would be nonvolatile; but they would also be faster, would consume less power, and would be able to stand up to hazardous environments more easily. Such chips would have obvious applications in storage cards for digital cameras and music-players; they would enable hand-held and laptop computers to boot up more quickly and to operate for longer; they would allow desktop computers to run faster; they would doubtless have military and space-faring advantages too. But although the theory behind them looks solid, there are tricky practical problems that need to be overcome.

Two different approaches, based on different magnetic phenomena, are being pursued. The first, being investigated by Gary Prinz and his colleagues at the Naval Research Laboratory (NRL) in Washington, D.C., exploits the fact that the electrical resistance of some materials changes in the presence of a magnetic field- a phenomenon known as magneto-resistance. For some multi-layered materials this effect is particularly powerful and is, accordingly, called "giant" magneto-resistance (GMR). Since 1997, the exploitation of GMR has made cheap multi-gigabyte hard disks commonplace. The magnetic orientations of

the magnetised spots on the surface of a spinning disk are detected by measuring the changes they induce in the resistance of a tiny sensor. This technique is so sensitive that it means the spots can be made smaller and packed closer together than was previously possible, thus increasing the capacity and reducing the size and cost of a disk drive.

Dr. Prinz and his colleagues are now exploiting the same phenomenon on the surface of memory chips, rather than spinning disks. In a conventional memory chip, each binary digit (bit) of data is represented using a capacitor-reservoir of electrical charge that is either empty or full-to represent a zero or a one. In the NRL's magnetic design, by contrast, each bit is stored in a magnetic element in the form of a vertical pillar of magnetisable material. A matrix of wires passing above and below the elements allows each to be magnetised, either clockwise or anti-clockwise, to represent zero or one. Another set of wires allows current to pass through any particular element. By measuring an element's resistance you can determine its magnetic orientation, and hence whether it is storing a zero or a one. Since the elements retain their magnetic orientation even when the power is off, the result is non-volatile memory. Unlike the elements of an electronic memory, a magnetic memory's elements are not easily disrupted by radiation. And compared with electronic memories, whose capacitors need constant topping up, magnetic memories are simpler and consume less power. The NRL researchers plan to commercialise their device through a company called Non-Volatile Electronics, which recently began work on the necessary processing and fabrication techniques. But it will be some years before the first chips roll off the production line.

Most attention in the field is focused on an alternative approach based on magnetic tunnel-junctions (MTJs), which are being investigated by researchers at chip makers such as IBM, Motorola, Siemens and HewlettPackard. ## 5.16.18 Passage Reading: CAT 2000 | Question: 23 top

**The passage given below is followed by questions. Choose the best answer for each question.**

In a modern computer, electronic and magnetic storage technologies play complementary roles. Electronic memory chips are fast but volatile (their contents are lost when the computer is unplugged). Magnetic tapes and hard disks are slower, but have the advantage that they are non-volatile, so that they can be used to store software and documents even when the power is off.

In laboratories around the world, however, researchers are hoping to achieve the best of both worlds. They are trying to build magnetic memory chips that could be used in place of today's electronic ones. These magnetic memories would be nonvolatile; but they would also be faster, would consume less power, and would be able to stand up to hazardous environments more easily. Such chips would have obvious applications in storage cards for digital cameras and music-players; they would enable hand-held and laptop computers to boot up more quickly and to operate for longer; they would allow desktop computers to run faster; they would doubtless have military and space-faring advantages too. But although the theory behind them looks solid, there are tricky practical problems that need to be overcome.

Two different approaches, based on different magnetic phenomena, are being pursued. The first, being investigated by Gary Prinz and his colleagues at the Naval Research Laboratory (NRL) in Washington, D.C., exploits the fact that the electrical resistance of some materials changes in the presence of a magnetic field- a phenomenon known as magneto-resistance. For some multi-layered materials this effect is particularly powerful and is, accordingly, called "giant" magneto-resistance (GMR). Since 1997, the exploitation of GMR has made cheap multi-gigabyte hard disks commonplace. The magnetic orientations of the magnetised spots on the surface of a spinning disk are detected by measuring the changes they induce in the resistance of a tiny sensor. This technique is so sensitive that it means the spots can be made smaller and packed closer together than was previously possible, thus increasing the capacity and reducing the size and cost of a disk drive.

Dr. Prinz and his colleagues are now exploiting the same phenomenon on the surface of memory chips, rather than spinning disks. In a conventional memory chip, each binary digit (bit) of data is represented using a capacitor-reservoir of electrical charge that is either empty or full-to represent a zero or a one. In the NRL's magnetic design, by contrast, each bit is stored in a magnetic element in the form of a vertical pillar of magnetisable material. A matrix of wires passing above and below the elements allows each to be magnetised, either clockwise or anti-clockwise, to represent zero or one. Another set of wires allows current to pass through any particular element. By measuring an element's resistance you can determine its magnetic orientation, and hence whether it is storing a zero or a one. Since the elements retain their magnetic orientation even when the power is off, the result is non-volatile memory. Unlike the elements of an electronic memory, a magnetic memory's elements are not easily disrupted by radiation. And compared with electronic memories, whose capacitors need constant topping up, magnetic memories are simpler and consume less power. The NRL researchers plan to commercialise their device through a company called Non-Volatile Electronics, which recently began work on the necessary processing and fabrication techniques. But it will be some years before the first chips roll off the production line.

Most attention in the field is focused on an alternative approach based on magnetic tunnel-junctions (MTJs), which are being investigated by researchers at chip makers such as IBM, Motorola, Siemens and HewlettPackard. IBM's research team, led by Stuart Parkin, has already created a 500-element working prototype that operates at 20 times the speed of conventional memory chips and consumes 1% of the power. Each element consists of a sandwich of two layers of magnetisable material separated by a barrier of aluminium oxide just four or five atoms thick. The polarisation of lower magnetisable layer is fixed in one direction, but that of the upper layer can be set (again, by passing a current through a matrix of control wires) either to the left or to the right, to store a zero or a one. The polarisations of the two layers are then in either the same or opposite directions.

Although the aluminium-oxide barrier is an electrical insulator, it is so thin that electrons are able to jump across it via a quantum-mechanical effect called tunnelling. It turns out that such tunnelling is easier when the two magnetic layers are polarised in the same direction than when they are polarised in opposite directions. So, by measuring the current that flows through the sandwich, it is possible to determine the alignment of the topmost layer, and hence whether it is storing a zero or a one.

To build a full-scale memory chip based on MTJs is, however, no easy matter. According to Paulo Freitas, an expert on chip manufacturing at the Technical University of Lisbon, magnetic memory elements will have to become far smaller and more reliable than current prototypes if they are to compete with electronic memory. At the same time, they will have to be sensitive enough to respond when the appropriate wires in the control matrix are switched on, but not so sensitive that they respond when a neighbouring element is changed. Despite these difficulties, the general consensus is that MTJs are the more promising ideas. Dr. Parkin says his group evaluated the GMR approach and decided not to pursue it, despite the fact that IBM pioneered GMR in hard disks. Dr. Prinz, however, contends that his plan will eventually offer higher storage densities and lower production costs.

Not content with shaking up the multi-billion-dollar market for computer memory, some researchers have even more ambitious plans for magnetic computing. In a paper published last month in Science, Russell Cowburn and Mark Welland at Cambridge University outlined research that could form the basis of a magnetic microprocessor- a chip capable of manipulating (rather than merely storing) information magnetically. Whether all-magnetic computers will ever be able to compete with other contenders that are jostling to knock electronics off its

perch-such as optical, biological and quantum computing-remains to be seen. Dr. Cowburn suggests that the future lies with hybrid machines that use different technologies. But computing with magnetism evidently has an attraction all its own.

Experimental research currently underway, using rows of magnetic dots, each of which could be polarised in one of the two directions, has led to the demonstration of

A. working of a microprocessor.
B. working of a logic gate.
C. working of a magneto-resistance based chip.
D. working of a magneto tunnelling-junction (MTJ) based chip.

cat2000 verbal-ability passage-reading

## 5.16.19 Passage Reading: CAT 2000 | Question: 24 top

**The passage given below is followed by questions. Choose the best answer for each question.**

In a modern computer, electronic and magnetic storage technologies play complementary roles. Electronic memory chips are fast but volatile (their contents are lost when the computer is unplugged). Magnetic tapes and hard disks are slower, but have the advantage that they are non-volatile, so that they can be used to store software and documents even when the power is off.

In laboratories around the world, however, researchers are hoping to achieve the best of both worlds. They are trying to build magnetic memory chips that could be used in place of today's electronic ones. These magnetic memories would be nonvolatile; but they would also be faster, would consume less power, and would be able to stand up to hazardous environments more easily. Such chips would have obvious applications in storage cards for digital cameras and music-players; they would enable hand-held and laptop computers to boot up more quickly and to operate for longer; they would allow desktop computers to run faster; they would doubtless have military and space-faring advantages too. But although the theory behind them looks solid, there are tricky practical problems that need to be overcome.

Two different approaches, based on different magnetic phenomena, are being pursued. The first, being investigated by Gary Prinz and his colleagues at the Naval Research Laboratory (NRL) in Washington, D.C., exploits the fact that the electrical resistance of some materials changes in the presence of a magnetic field- a phenomenon known as magneto-resistance. For some multi-layered materials this effect is particularly powerful and is, accordingly, called "giant" magneto-resistance (GMR). Since 1997, the exploitation of GMR has made cheap multi-gigabyte hard disks commonplace. The magnetic orientations of the magnetised spots on the surface of a spinning disk are detected by measuring the changes they induce in the resistance of a tiny sensor. This technique is so sensitive that it means the spots can be made smaller and packed closer together than was previously possible, thus increasing the capacity and reducing the size and cost of a disk drive.

Dr. Prinz and his colleagues are now exploiting the same phenomenon on the surface of memory chips, rather than spinning disks. In a conventional memory chip, each binary digit (bit) of data is represented using a capacitor-reservoir of electrical charge that is either empty or full-to represent a zero or a one. In the NRL's magnetic design, by contrast, each bit is stored in a magnetic element in the form of a vertical pillar of magnetisable material. A matrix of wires passing above and below the elements allows each to be magnetised, either clockwise or anti-clockwise, to represent zero or one. Another set of wires allows current to pass through any particular element. By measuring an element's resistance you can determine its magnetic orientation, and hence whether it is storing a zero or a one. Since the elements retain their magnetic orientation even when the power is off, the result is non-volatile memory. Unlike the elements of an electronic memory, a magnetic memory's elements are not easily disrupted by radiation. And compared with electronic memories, whose capacitors need constant topping up, magnetic memories are simpler and consume less power. The NRL researchers plan to commercialise their device through a company called Non-Volatile Electronics, which recently began work on the necessary processing and fabrication techniques. But it will be some years before the first chips roll off the production line.

Most attention in the field is focused on an alternative approach based on magnetic tunnel-junctions (MTJs), which are being investigated by researchers at chip makers such as IBM, Motorola, Siemens and HewlettPackard. IBM's research team, led by Stuart Parkin, has already created a $500-$ element working prototype that operates at 20 times the speed of conventional memory chips and consumes 1% of the power. Each element consists of a sandwich of two layers of magnetisable material separated by a barrier of aluminium oxide just four or five atoms thick. The polarisation of lower magnetisable layer is fixed in one direction, but that of the upper layer can be set (again, by passing a current through a matrix of control wires) either to the left or to the right, to store a zero or a one. The polarisations of the two layers are then in either the same or opposite directions.

Although the aluminium-oxide barrier is an electrical insulator, it is so thin that electrons are able to jump across it via a quantum-mechanical effect called tunnelling. It turns out that such tunnelling is easier when the two magnetic layers are polarised in the same direction than when they are polarised in opposite directions. So, by measuring the current that flows through the sandwich, it is possible to determine the alignment of the topmost layer, and hence whether it is storing a zero or a one.

To build a full-scale memory chip based on MTJs is, however, no easy matter. According to Paulo Freitas, an expert on chip manufacturing at the Technical University of Lisbon, magnetic memory elements will have to become far smaller and more reliable than current prototypes if they are to compete with electronic memory. At the same time, they will have to be sensitive enough to respond when the appropriate wires in the control matrix are switched on, but not so sensitive that they respond when a neighbouring element is changed. Despite these difficulties, the general consensus is that MTJs are the more promising

ideas. Dr. Parkin says his group evaluated the GMR approach and decided not to pursue it, despite the fact that IBM pioneered GMR in hard disks. Dr. Prinz, however, contends that his plan will eventually offer higher storage densities and lower production costs.

Not content with shaking up the multi-billion-dollar market for computer memory, some researchers have even more ambitious plans for magnetic computing. In a paper published last month in Science, Russell Cowburn and Mark Welland at Cambridge University outlined research that could form the basis of a magnetic microprocessor- a chip capable of manipulating (rather than merely storing) information magnetically. In place of conducting wires, a magnetic processor would have rows of magnetic dots, each of which could be polarised in one of two directions. Individual bits of information would travel down the rows as magnetic pulses, changing the orientation of the dots as they went. Dr. Cowburn and Dr. Welland have demonstrated how a logic gate (the basic element of a microprocessor) could work in such a scheme. In their experiment, they fed a signal in at one end of the chain of dots and used a second signal to control whether it propagated along the chain.

It is, admittedly, a long way from a single logic gate to a full microprocessor, but this was true also when the transistor was first invented. Dr. Cowburn, who is now searching for backers to help commercialise the technology, says he believes it will be at least ten years before the first magnetic microprocessor is constructed. But other researchers in the field agree that such a chip is the next logical step. Dr. Prinz says that once magnetic memory is sorted out "the target is to go after the logic circuits." Whether all-magnetic computers will ever be able to compete with other contenders that are jostling to knock electronics off its perch-such as optical, biological and quantum computing-remains to be seen. Dr. Cowburn suggests that the future lies with hybrid machines that use different technologies. But computing with magnetism evidently has an attraction all its own.

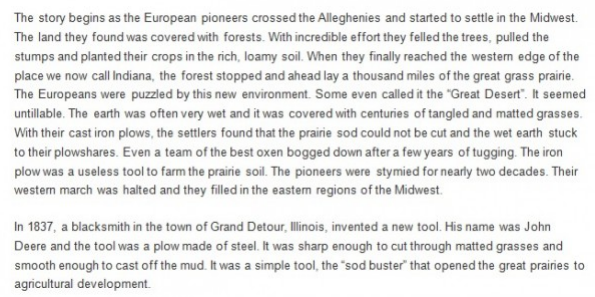
From the passage, which of the following cannot be inferred?

A. Electronic memory chips are faster and nonvolatile.
B. Electronic and magnetic storage technologies play a complementary role.
C. MTJs are the more promising idea, compared to the magneto-resistance approach.
D. Non-volatile Electronics is the company set up to commercialise the GMR chips.

cat2000 verbal-ability passage-reading

## 5.16.20 Passage Reading: CAT 2000 | Question: 25 top

**The passage given below is followed by a question. Choose the best answer.**



The story begins as the European pioneers crossed the Alleghenies and started to settle in the Midwest. The land they found was covered with forests. With incredible effort they felled the trees, pulled the stumps and planted their crops in the rich, loamy soil. When they finally reached the western edge of the place we now call Indiana, the forest stopped and ahead lay a thousand miles of the great grass prairie. The Europeans were puzzled by this new environment. Some even called it the "Great Desert". It seemed untillable. The earth was often very wet and it was covered with centuries of tangled and matted grasses. With their cast iron plows, the settlers found that the prairie sod could not be cut and the wet earth stuck to their plowshares. Even a team of the best oxen bogged down after a few years of tugging. The iron plow was a useless tool to farm the prairie soil. The pioneers were stymied for nearly two decades. Their western march was halted and they filled in the eastern regions of the Midwest.

In 1837, a blacksmith in the town of Grand Detour, Illinois, invented a new tool. His name was John Deere and the tool was a plow made of steel. It was sharp enough to cut through matted grasses and smooth enough to cast off the mud. It was a simple tool, the "sod buster" that opened the great prairies to agricultural development.

The story begins as the European pioneers crossed the Alleghenies and started to settle in the Midwest. The land they found was covered with forests. With incredible effort they felled the trees, pulled the stumps and planted their crops in the rich, loamy soil. When they finally reached the western edge of the place we now call Indiana, the forest stopped and ahead lay a thousand miles of the great grass prairie. The Europeans were puzzled by this new environment. Some even called it the 'Great Desert'. It seemed untillable. The earth was often very wet and it was covered with centuries of tangled and matted grasses. With their cast iron plows, the settles found that the prairie sod could not be cut and the wet earth stuck to their plowshares. Even a team of the best oxen bogged down after a few years of tugging. The iron plow was a useless tool to farm the prairie soil. The pioneers were stymied for nearly two decades. Their western march was halted and they filled in the eastern regions of the Midwest.

In 1837, a blacksmith in the town of grand Detour, lllinois, invented a new tool. His name was John Deere and the tool was a plow made of steel. It was sharp enough to cut through matted grasses and smooth enough to cast off the mud. It was a simple tool, the "sod buster" that opened the great prairies to agricultural development.

Sauk County, Wisconsin is the part of that prairie where I have a home. It is named after the Sauk Indians. In 1673, Father Marquette was the first European to lay his eyes upon their land. He found a village laid out in regular patterns on a plain beside the Wisconsin River. He called the place Prairie du Sac. The village was surrounded by fields that had provided maize, beans and squash for the Sauk people for generations reaching back into the unrecorded time.

When the European settlers arrived at the Sauk prairie in 1837, the government forced the native Sauk people west of the Mississippi River. The settlers came with John Deere's new invention and used the tool to open the area to a new kind of agriculture. They ignored the traditional ways of the Sauk Indians and used their sod-busting tool for planting wheat. Initially, the soil was generous and the farmers thrived. However, each year the soil lost more of its nurturing power. It was only thirty

years after the Europeans arrived with their new technology that the land was depleted. Wheat farming became uneconomic and tens of thousands of farmers left Wisconsin seeking new land with sod to bust.

It took the Europeans and their new technology just one generation to make their homeland into a desert. The Sauk Indians who knew how to sustain themselves on the Sauk prairie land were banished to another kind of desert called a reservation. And they even forgot about the techniques and tools that had sustained them on the prairie for generations unrecorded. And that is how it was that three deserts were created- Wisconsin, the reservation and the memories of a people. A century later, the land of the Sauks is now populated by the children of a second wave of European farmers who learned to replenish the soil through the regenerative powers of dairying, ground cover crops and animal manures. These third and fourth generation farmers and townspeople do not realise, however, that a new settler is coming soon with an invention as powerful as John Deere's plow.

The new technology is called 'bereavement counselling'. It is a tool forged at the great state university, an innovative technique to meet the needs of those experiencing the death of a loved one, a tool that can "process" the grief of the people who now live on the Prairie of the Sauk. As one can imagine the final days of the village of the Sauk Indians before the arrival of the settlers with John Deere's plow, one can also imagine these final days before the arrival of the first bereavement counsellor at Prairie du Sac. In these final days, the farmers and the townspeople mourn at the death of a mother, brother, son or friend. The bereaved is joined by neighbours and kin. They meet grief together in lamentation, prayer and song. They call upon the words of the clergy and surround themselves in community.

It is in these ways that they grieve and then go on with life. Through their mourning they are assured of the bonds between them and renewed in the knowledge that this death is a part of the Prairie of the Sauk. Their grief is common property, anguish from which the community draws strength and gives the bereaved the courage to move ahead.

It is into this prairie community that the bereavement counsellor arrives with the new grief technology. The counsellor calls the invention a service and assures the prairie folk of its effectiveness and superiority by invoking the name of the great university while displaying a diploma and certificate. At first, we can imagine that the local people will be puzzled by the bereavement counsellor's claim. However, the counsellor will tell a few of them that the new technique is merely to assist the bereaved's community at the time of death. To some other prairie folk who are isolated or forgotten, the counsellor will approach the County Board and advocate the right to treatment for these unfortunate souls. This right will be guaranteed by the Board's decision to reimburse those too poor to pay for counselling services. There will be others, schooled to believe in the innovative new tools certified by universities and medical centres, who will seek out the bereavement counsellor by force of habit. And one of these people will tell a bereaved neighbour who is unschooled that unless his grief is processed by a counsellor, he will probably have major psychological problems in later life. Several people will begin to use the bereavement counsellor because, since the County Board now taxes them to insure access to the technology, they will feel that to fail to be counselled is to waste their money, and to be denied a benefit, or even a right.

Finally, one day, the aged father of a Sauk woman will die. And the next door neighbour will not drop by because he doesn't want to interrupt the bereavement counsellor. The woman's kin will stay home because they will have learned that only the bereavement counsellor knows how to process grief the proper way. The local clergy will seek technical assistance from the bereavement counsellor to learn the correct form of service to deal with guilt and grief. And the grieving daughter will know that it is the bereavement counsellor who really cares for her because only the bereavement counsellor comes when death visits this family on the Prairie of the Sauk.

It will be only one generation between the bereavement counsellor arrives and the community of mourners disappears. The counsellor's new tool will cut through the social fabric, throwing aside kinship, care, neighbourly obligations and community ways of coming together and going on. Like John Deere's plow, the tools of bereavement counselling will create a desert where a community once flourished. And finally, even the bereavement counsellor will see the impossibility of restoring hope in clients once they are genuinely alone with nothing but a service for consolation. In the inevitable failure of the service, the bereavement counsellor will find the deserts even in herself.

Which one of the following best describes the approach of the author?

A. Comparing experiences with two innovations tried, in order to illustrate the failure of both.
B. Presenting community perspectives on two technologies which have had negative effects on people.
C. Using the negative outcomes of one innovation to illustrate the likely outcomes of another innovation.
D. Contrasting two contexts separated in time, to illustrate how 'deserts' have arisen.

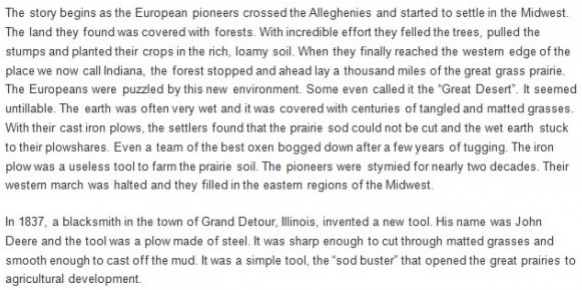
## 5.16.21 Passage Reading: CAT 2000 | Question: 26 top

**The passage given below is followed by a question. Choose the best answer.**



The story begins as the European pioneers crossed the Alleghenies and started to settle in the Midwest. The land they found was covered with forests. With incredible effort they felled the trees, pulled the stumps and planted their crops in the rich, loamy soil. When they finally reached the western edge of the place we now call Indiana, the forest stopped and ahead lay a thousand miles of the great grass prairie. The Europeans were puzzled by this new environment. Some even called it the "Great Desert". It seemed untillable. The earth was often very wet and it was covered with centuries of tangled and matted grasses. With their cast iron plows, the settlers found that the prairie sod could not be cut and the wet earth stuck to their plowshares. Even a team of the best oxen bogged down after a few years of tugging. The iron plow was a useless tool to farm the prairie soil. The pioneers were stymied for nearly two decades. Their western march was halted and they filled in the eastern regions of the Midwest.

In 1837, a blacksmith in the town of Grand Detour, Illinois, invented a new tool. His name was John Deere and the tool was a plow made of steel. It was sharp enough to cut through matted grasses and smooth enough to cast off the mud. It was a simple tool, the "sod buster" that opened the great prairies to agricultural development.

Sauk County, Wisconsin is the part of that prairie where I have a home. It is named after the Sauk Indians. In 1673, Father Marquette was the first European to lay his eyes upon their land. He found a village laid out in regular patterns on a plain beside the Wisconsin River. He called the place Prairie du Sac. The village was surrounded by fields that had provided maize, beans and squash for the Sauk people for generations reaching back into the unrecorded time.

When the European settlers arrived at the Sauk prairie in 1837, the government forced the native Sauk people west of the Mississippi River. The settlers came with John Deere's new invention and used the tool to open the area to a new kind of agriculture. They ignored the traditional ways of the Sauk Indians and used their sod-busting tool for planting wheat. Initially, the soil was generous and the farmers thrived. However, each year the soil lost more of its nurturing power. It was only thirty years after the Europeans arrived with their new technology that the land was depleted. Wheat farming became uneconomic and tens of thousands of farmers left Wisconsin seeking new land with sod to bust.

It took the Europeans and their new technology just one generation to make their homeland into a desert. The Sauk Indians who knew how to sustain themselves on the Sauk prairie land were banished to another kind of desert called a reservation. And they even forgot about the techniques and tools that had sustained them on the prairie for generations unrecorded. And that is how it was that three deserts were created- Wisconsin, the reservation and the memories of a people. A century later, the land of the Sauks is now populated by the children of a second wave of European farmers who learned to replenish the soil through the regenerative powers of dairying, ground cover crops and animal manures. These third and fourth generation farmers and townspeople do not realise, however, that a new settler is coming soon with an invention as powerful as John Deere's plow.

The new technology is called 'bereavement counselling'. It is a tool forged at the great state university, an innovative technique to meet the needs of those experiencing the death of a loved one, a tool that can "process" the grief of the people who now live on the Prairie of the Sauk. As one can imagine the final days of the village of the Sauk Indians before the arrival of the settlers with John Deere's plow, one can also imagine these final days before the arrival of the first bereavement counsellor at Prairie du Sac. In these final days, the farmers and the townspeople mourn at the death of a mother, brother, son or friend. The bereaved is joined by neighbours and kin. They meet grief together in lamentation, prayer and song. They call upon the words of the clergy and surround themselves in community.

It is in these ways that they grieve and then go on with life. Through their mourning they are assured of the bonds between them and renewed in the knowledge that this death is a part of the Prairie of the Sauk. Their grief is common property, anguish from which the community draws strength and gives the bereaved the courage to move ahead.

It is into this prairie community that the bereavement counsellor arrives with the new grief technology. The counsellor calls the invention a service and assures the prairie folk of its effectiveness and superiority by invoking the name of the great university while displaying a diploma and certificate. At first, we can imagine that the local people will be puzzled by the bereavement counsellor's claim. However, the counsellor will tell a few of them that the new technique is merely to assist the bereaved's community at the time of death. To some other prairie folk who are isolated or forgotten, the counsellor will approach the County Board and advocate the right to treatment for these unfortunate souls. This right will be guaranteed by the Board's decision to reimburse those too poor to pay for counselling services. There will be others, schooled to believe in the innovative new tools certified by universities and medical centres, who will seek out the bereavement counsellor by force of habit. And one of these people will tell a bereaved neighbour who is unschooled that unless his grief is processed by a counsellor, he will probably have major psychological problems in later life. Several people will begin to use the bereavement counsellor because, since the County Board now taxes them to insure access to the technology, they will feel that to fail to be counselled is to waste their money, and to be denied a benefit, or even a right.

Finally, one day, the aged father of a Sauk woman will die. And the next door neighbour will not drop by because he doesn't want to interrupt the bereavement counsellor. The woman's kin will stay home because they will have learned that only the bereavement counsellor knows how to process grief the proper way. The local clergy will seek technical assistance from the bereavement counsellor to learn the correct form of service to deal with guilt and grief. And the grieving daughter will know that it is the bereavement counsellor who really cares for her because only the bereavement counsellor comes when death visits this family on the Prairie of the Sauk.

It will be only one generation between the bereavement counsellor arrives and the community of mourners disappears. The counsellor's new tool will cut through the social fabric, throwing aside kinship, care, neighbourly obligations and community ways of coming together and going on. Like John Deere's plow, the tools of bereavement counselling will create a desert where a community once flourished. And finally, even the bereavement counsellor will see the impossibility of restoring hope in clients once they are genuinely alone with nothing but a service for consolation. In the inevitable failure of the service, the bereavement counsellor will find the deserts even in herself.

According to the passage, bereavement handling traditionally involves

A. the community bereavement counsellors working with the bereaved to help him/her overcome grief.
B. the neighbours and kin joining the bereaved and meeting grief together in mourning and prayer.
C. using techniques developed systematically in formal institutions of learning, a trained counsellor helping the bereaved cope with grief.
D. the Sauk Indian Chief leading the community with rituals and rites to help lessen the grief of the bereaved.

## 5.16.22 Passage Reading: CAT 2000 | Question: 27 top

**The passage given below is followed by a question. Choose the best answer.**

The story begins as the European pioneers crossed the Alleghenies and started to settle in the Midwest. The land they found was covered with forests. With incredible effort they felled the trees, pulled the stumps and planted their crops in the rich, loamy soil. When they finally reached the western edge of the place we now call Indiana, the forest stopped and ahead lay a thousand miles of the great grass prairie. The Europeans were puzzled by this new environment. Some even called it the "Great Desert". It seemed untillable. The earth was often very wet and it was covered with centuries of tangled and matted grasses. With their cast iron plows, the settlers found that the prairie sod could not be cut and the wet earth stuck to their plowshares. Even a team of the best oxen bogged down after a few years of tugging. The iron plow was a useless tool to farm the prairie soil. The pioneers were stymied for nearly two decades. Their western march was halted and they filled in the eastern regions of the Midwest.

In 1837, a blacksmith in the town of Grand Detour, Illinois, invented a new tool. His name was John Deere and the tool was a plow made of steel. It was sharp enough to cut through matted grasses and smooth enough to cast off the mud. It was a simple tool, the "sod buster" that opened the great prairies to agricultural development.

Sauk County, Wisconsin is the part of that prairie where I have a home. It is named after the Sauk Indians. In 1673, Father Marquette was the first European to lay his eyes upon their land. He found a village laid out in regular patterns on a plain beside the Wisconsin River. He called the place Prairie du Sac. The village was surrounded by fields that had provided maize, beans and squash for the Sauk people for generations reaching back into the unrecorded time.

When the European settlers arrived at the Sauk prairie in 1837, the government forced the native Sauk people west of the Mississippi River. The settlers came with John Deere's new invention and used the tool to open the area to a new kind of agriculture. They ignored the traditional ways of the Sauk Indians and used their sod-busting tool for planting wheat. Initially, the soil was generous and the farmers thrived. However, each year the soil lost more of its nurturing power. It was only thirty years after the Europeans arrived with their new technology that the land was depleted. Wheat farming became uneconomic and tens of thousands of farmers left Wisconsin seeking new land with sod to bust.

It took the Europeans and their new technology just one generation to make their homeland into a desert. The Sauk Indians who knew how to sustain themselves on the Sauk prairie land were banished to another kind of desert called a reservation. And they even forgot about the techniques and tools that had sustained them on the prairie for generations unrecorded. And that is how it was that three deserts were created- Wisconsin, the reservation and the memories of a people. A century later, the land of the Sauks is now populated by the children of a second wave of European farmers who learned to replenish the soil through the regenerative powers of dairying, ground cover crops and animal manures. These third and fourth generation farmers and townspeople do not realise, however, that a new settler is coming soon with an invention as powerful as John Deere's plow.

The new technology is called 'bereavement counselling'. It is a tool forged at the great state university, an innovative technique to meet the needs of those experiencing the death of a loved one, a tool that can "process" the grief of the people who now live on the Prairie of the Sauk. As one can imagine the final days of the village of the Sauk Indians before the arrival of the settlers with John Deere's plow, one can also imagine these final days before the arrival of the first bereavement counsellor at Prairie du Sac. In these final days, the farmers and the townspeople mourn at the death of a mother, brother, son or friend. The bereaved is joined by neighbours and kin. They meet grief together in lamentation, prayer and song. They call upon the words of the clergy and surround themselves in community.

It is in these ways that they grieve and then go on with life. Through their mourning they are assured of the bonds between them and renewed in the knowledge that this death is a part of the Prairie of the Sauk. Their grief is common property, anguish from which the community draws strength and gives the bereaved the courage to move ahead.

It is into this prairie community that the bereavement counsellor arrives with the new grief technology. The counsellor calls the invention a service and assures the prairie folk of its effectiveness and superiority by invoking the name of the great university while displaying a diploma and certificate. At first, we can imagine that the local people will be puzzled by the bereavement counsellor's claim. However, the counsellor will tell a few of them that the new technique is merely to assist the bereaved's community at the time of death. To some other prairie folk who are isolated or forgotten, the counsellor will approach the County Board and advocate the right to treatment for these unfortunate souls. This right will be guaranteed by the Board's decision to reimburse those too poor to pay for counselling services. There will be others, schooled to believe in the innovative new tools certified by universities and medical centres, who will seek out the bereavement counsellor by force of habit. And one of these people will tell a bereaved neighbour who is unschooled that unless his grief is processed by a counsellor, he will probably have major psychological problems in later life. Several people will begin to use the bereavement counsellor because, since the County Board now taxes them to insure access to the technology, they will feel that to fail to be counselled is to waste

their money, and to be denied a benefit, or even a right.

Finally, one day, the aged father of a Sauk woman will die. And the next door neighbour will not drop by because he doesn't want to interrupt the bereavement counsellor. The woman's kin will stay home because they will have learned that only the bereavement counsellor knows how to process grief the proper way. The local clergy will seek technical assistance from the bereavement counsellor to learn the correct form of service to deal with guilt and grief. And the grieving daughter will know that it is the bereavement counsellor who really cares for her because only the bereavement counsellor comes when death visits this family on the Prairie of the Sauk.

It will be only one generation between the bereavement counsellor arrives and the community of mourners disappears. The counsellor's new tool will cut through the social fabric, throwing aside kinship, care, neighbourly obligations and community ways of coming together and going on. Like John Deere's plow, the tools of bereavement counselling will create a desert where a community once flourished. And finally, even the bereavement counsellor will see the impossibility of restoring hope in clients once they are genuinely alone with nothing but a service for consolation. In the inevitable failure of the service, the bereavement counsellor will find the deserts even in herself.

Due to which of the following reasons, according to the author, will the bereavement counsellor find the deserts even in herself?

A. Over a period of time, working with Sauk Indians who have lost their kinship and relationships, she becomes one of them.
B. She is working in an environment where the disappearance of community mourners makes her work place a social desert.
C. Her efforts at grief processing with the bereaved will fail as no amount of professional service can make up for the loss due to the disappearance of community mourners.
D. She has been working with people who have settled for a long time in the Great Desert.

Several people will begin to use the bereavement counsellor because, since the County Board now taxes them to insure access to the technology, they will feel that to fail to be counselled is to waste their money, and to be denied a benefit, or even a right.

Finally, one day, the aged father of a Sauk woman will die. And the next door neighbour will not drop by because he doesn't want to interrupt the bereavement counsellor. The woman's kin will stay home because they will have learned that only the bereavement counsellor knows how to process grief the proper way. The local clergy will seek technical assistance from the bereavement counsellor to learn the correct form of service to deal with guilt and grief. And the grieving daughter will know that it is the bereavement counsellor who really cares for her because only the bereavement counsellor comes when death visits this family on the Prairie of the Sauk.

It will be only one generation between the bereavement counsellor arrives and the community of mourners disappears. The counsellor's new tool will cut through the social fabric, throwing aside kinship, care, neighbourly obligations and community ways of coming together and going on. Like John Deere's plow, the tools of bereavement counselling will create a desert where a community once flourished. And finally, even the bereavement counsellor will see the impossibility of restoring hope in clients once they are genuinely alone with nothing but a service for consolation. In the inevitable failure of the service, the bereavement counsellor will find the deserts even in herself.

According to the author, the bereavement counsellor is

A. a friend of the bereaved helping him or her handle grief.
B. an advocate of the right to treatment for the community.
C. a kin of the bereaved helping him/her handle grief.
D. a formally trained person helping the bereaved handle grief.

cat2000 verbal-ability passage-reading

## 5.16.24 Passage Reading: CAT 2000 | Question: 29 top

**The passage given below is followed by a question. Choose the best answer.**

The story begins as the European pioneers crossed the Alleghenies and started to settle in the Midwest. The land they found was covered with forests. With incredible effort they felled the trees, pulled the stumps and planted their crops in the rich, loamy soil. When they finally reached the western edge of the place we now call Indiana, the forest stopped and ahead lay a thousand miles of the great grass prairie. The Europeans were puzzled by this new environment. Some even called it the "Great Desert". It seemed untillable. The earth was often very wet and it was covered with centuries of tangled and matted grasses. With their cast iron plows, the settlers found that the prairie sod could not be cut and the wet earth stuck to their plowshares. Even a team of the best oxen bogged down after a few years of tugging. The iron plow was a useless tool to farm the prairie soil. The pioneers were stymied for nearly two decades. Their western march was halted and they filled in the eastern regions of the Midwest.

In 1837, a blacksmith in the town of Grand Detour, Illinois, invented a new tool. His name was John Deere and the tool was a plow made of steel. It was sharp enough to cut through matted grasses and smooth enough to cast off the mud. It was a simple tool, the "sod buster" that opened the great prairies to agricultural development.

Sauk County, Wisconsin is the part of that prairie where I have a home. It is named after the Sauk Indians. In 1673, Father Marquette was the first European to lay his eyes upon their land. He found a village laid out in regular patterns on a plain beside the Wisconsin River. He called the place Prairie du Sac. The village was surrounded by fields that had provided maize, beans and squash for the Sauk people for generations reaching back into the unrecorded time.

When the European settlers arrived at the Sauk prairie in 1837, the government forced the native Sauk people west of the Mississippi River. The settlers came with John Deere's new invention and used the tool to open the area to a new kind of agriculture. They ignored the traditional ways of the Sauk Indians and used their sod-busting tool for planting wheat. Initially, the soil was generous and the farmers thrived. However, each year the soil lost more of its nurturing power. It was only thirty years after the Europeans arrived with their new technology that the land was depleted. Wheat farming became uneconomic and tens of thousands of farmers left Wisconsin seeking new land with sod to bust.

It took the Europeans and their new technology just one generation to make their homeland into a desert. The Sauk Indians who knew how to sustain themselves on the Sauk prairie land were banished to another kind of desert called a reservation. And

they even forgot about the techniques and tools that had sustained them on the prairie for generations unrecorded. And that is how it was that three deserts were created- Wisconsin, the reservation and the memories of a people. A century later, the land of the Sauks is now populated by the children of a second wave of European farmers who learned to replenish the soil through the regenerative powers of dairying, ground cover crops and animal manures. These third and fourth generation farmers and townspeople do not realise, however, that a new settler is coming soon with an invention as powerful as John Deere's plow.

The new technology is called 'bereavement counselling'. It is a tool forged at the great state university, an innovative technique to meet the needs of those experiencing the death of a loved one, a tool that can "process" the grief of the people who now live on the Prairie of the Sauk. As one can imagine the final days of the village of the Sauk Indians before the arrival of the settlers with John Deere's plow, one can also imagine these final days before the arrival of the first bereavement counsellor at Prairie du Sac. In these final days, the farmers and the townspeople mourn at the death of a mother, brother, son or friend. The bereaved is joined by neighbours and kin. They meet grief together in lamentation, prayer and song. They call upon the words of the clergy and surround themselves in community.

It is in these ways that they grieve and then go on with life. Through their mourning they are assured of the bonds between them and renewed in the knowledge that this death is a part of the Prairie of the Sauk. Their grief is common property, anguish from which the community draws strength and gives the bereaved the courage to move ahead.

It is into this prairie community that the bereavement counsellor arrives with the new grief technology. The counsellor calls the invention a service and assures the prairie folk of its effectiveness and superiority by invoking the name of the great university while displaying a diploma and certificate. At first, we can imagine that the local people will be puzzled by the bereavement counsellor's claim. However, the counsellor will tell a few of them that the new technique is merely to assist the bereaved's community at the time of death. To some other prairie folk who are isolated or forgotten, the counsellor will approach the County Board and advocate the right to treatment for these unfortunate souls. This right will be guaranteed by the Board's decision to reimburse those too poor to pay for counselling services. There will be others, schooled to believe in the innovative new tools certified by universities and medical centres, who will seek out the bereavement counsellor by force of habit. And one of these people will tell a bereaved neighbour who is unschooled that unless his grief is processed by a counsellor, he will probably have major psychological problems in later life. Several people will begin to use the bereavement counsellor because, since the County Board now taxes them to insure access to the technology, they will feel that to fail to be counselled is to waste their money, and to be denied a benefit, or even a right.

Finally, one day, the aged father of a Sauk woman will die. And the next door neighbour will not drop by because he doesn't want to interrupt the bereavement counsellor. The woman's kin will stay home because they will have learned that only the bereavement counsellor knows how to process grief the proper way. The local clergy will seek technical assistance from the bereavement counsellor to learn the correct form of service to deal with guilt and grief. And the grieving daughter will know that it is the bereavement counsellor who really cares for her because only the bereavement counsellor comes when death visits this family on the Prairie of the Sauk.

It will be only one generation between the bereavement counsellor arrives and the community of mourners disappears. The counsellor's new tool will cut through the social fabric, throwing aside kinship, care, neighbourly obligations and community ways of coming together and going on. Like John Deere's plow, the tools of bereavement counselling will create a desert where a community once flourished. And finally, even the bereavement counsellor will see the impossibility of restoring hope in clients once they are genuinely alone with nothing but a service for consolation. In the inevitable failure of the service, the bereavement counsellor will find the deserts even in herself.

The Prairie was a great puzzlement for the European pioneers because

A. it was covered with thick, untillable layers of grass over a vast stretch.
B. it was a large desert immediately next to lush forests.
C. it was rich cultivable land left fallow for centuries.
D. it could be easily tilled with iron plows.

cat2000 verbal-ability passage-reading

## 5.16.25 Passage Reading: CAT 2000 | Question: 3 top

**The passage given below is followed by a question. Choose the best answer.**

The current debate on intellectual property rights (IPRs) raises a number of important issues concerning the strategy and policies for building a more dynamic national agricultural research system, the relative roles of public and private sectors, and the role of agribusiness multinational corporations (MNCs). This debate has been stimulated by the international agreement on Trade Related Intellectual Property Rights (TRIPs), negotiated as part of the Uruguay Round. TRIPs, for the first time, seeks to bring innovations in agricultural technology under a new worldwide IPR regime. The agribusiness MNCs (along with pharmaceutical companies) played a leading part in lobbying for such a regime during the Uruguay Round negotiations. The argument was that incentives are necessary to stimulate innovations, and that this calls for a system of patents which gives innovators the sole right to use (or sell/lease the right to use) their innovations for a specified period and protects them against unauthorised copying or use. With strong support of their national governments, they were influential in shaping the agreement on TRIPs, which eventually emerged from the Uruguay Round.

The current debate on TRIPs in India- as indeed elsewhere- echoes wider concerns about 'privatisation' of research and allowing a free field for MNCs in the sphere of biotechnology and agriculture. The agribusiness corporations, and those with

unbounded faith in the power of science to overcome all likely problems, point to the vast potential that new technology holds for solving the problems of hunger, malnutrition and poverty in the world. The exploitation of this potential should be encouraged and this is best done by the private sector for which patents are essential. Some, who do not necessarily accept this optimism, argue that fears of MNC domination are exaggerated and that farmers will accept their products only if they decisively outperform the available alternatives. Those who argue against agreeing to introduce an IPR regime in agriculture and encouraging private sector research are apprehensive that this will work to the disadvantage of farmers by making them more and more dependent on monopolistic MNCs. A different, though related apprehension is that extensive use of hybrids and genetically engineered new varieties might increase the vulnerability of agriculture to outbreaks of pests and diseases. The larger, longer-term consequences of reduced biodiversity that may follow from the use of specially bred varieties are also another cause for concern. Moreover, corporations, driven by the profit motive, will necessarily tend to underplay, if not ignore, potential adverse consequences, especially those which are unknown and which may manifest themselves only over a relatively long period. On the other hand, high pressure advertising and aggressive sales campaigns by private companies can seduce farmers into accepting varieties without being aware of potential adverse effects and the possibility of disastrous consequences for their livelihood if these varieties happen to fail. There is no provision under the laws, as they now exist, for compensating users against such eventualities.

Excessive preoccupation with seeds and seed material has obscured other important issues involved in reviewing the research policy. We need to remind ourselves that improved varieties by themselves are not sufficient for sustained growth of yields. In our own experience, some of the early high yielding varieties (HYVs) of rice and wheat were found susceptible to widespread pest attacks; and some had problems of grain quality. Further research was necessary to solve these problems. This largely successful research was almost entirely done in public research institutions. Of course, it could in principle have been done by private companies, but whether they choose to do so depends crucially on the extent of the loss in market for their original introductions on account of the above factors and whether the companies are financially strong enough to absorb the ‘losses’, invest in research to correct the deficiencies and recover the lost market. Public research, which is not driven by profit, is better placed to take corrective action. Research for improving common pool resource management, maintaining ecological health and ensuring sustainability is both critical and also demanding in terms of technological challenge and resource requirements. As such research is crucial to the impact of new varieties, chemicals and equipment in the farmer’s field, private companies should be interested in such research. But their primary interest is in the sale of seed material, chemicals, equipment and other inputs produced by them. Knowledge and techniques for resource management are not ‘marketable’ in the same way as those inputs. Their application to land, water and forests has a long gestation and their efficacy depends on resolving difficult problems such as designing institutions for proper and equitable management of common pool resources. Public or quasi-public research institutions informed by broader, long-term concerns can only do such work.

The public sector must therefore continue to play a major role in the national research system. It is both wrong and misleading to pose the problem in terms of public sector versus private sector or of privatisation of research. We need to address problems likely to arise on account of the publicprivatesector complementarily, and ensure that the public research system performs efficiently. Complementarily between various elements of research raises several issues in implementing an IPR regime. Private companies do not produce new varieties and inputs entirely as a result of their own research. Almost all technological improvement is based on knowledge and experience accumulated from the past, and the results of basic and applied research in public and quasi-public institutions (universities, research organisations). Moreover, as is increasingly recognised, accumulated stock of knowledge does not reside only in the scientific community and its academic publications, but is also widely diffused in traditions and folk knowledge of local communities all over.

The deciphering of the structure and functioning of DNA forms the basis of much of modern biotechnology. But this fundamental breakthrough is a ‘public good’ freely accessible in the public domain and usable free of any charge. Varieties/techniques developed using that knowledge can however be, and are, patented for private profit. Similarly, private corporations draw extensively, and without any charge, on germ plasm available in varieties of plants species (neem and turmeric are by now famous examples). Publicly funded gene banks as well as new varieties bred by public sector research stations can also be used freely by private enterprises for developing their own varieties and seek patent protection for them. Should private breeders be allowed free use of basic scientific discoveries? Should the repositories of traditional knowledge and germ plasm be collected which are maintained and improved by publicly funded institutions? Or should users be made to pay for such use? If they are to pay, what should be the basis of compensation? Should the compensation be for individuals or for communities/institutions to which they belong? Should individuals/ institutions be given the right of patenting their innovations? These are some of the important issues that deserve more attention than they now get and need serious detailed study to evolve reasonably satisfactory, fair and workable solutions. Finally, the tendency to equate the public sector with the government is wrong. The public space is much wider than government departments and includes co-operatives, universities, public trust and a variety of non-governmental organizations (NGOs). Giving greater autonomy to research organizations from government control and giving non-government public institutions the space and resources to play a larger, more effective role in research, is therefore an issue of direct relevance in restructuring the public research system.

In debating the respective roles of the public and private sectors in the national research system, it is important to recognise

A. that private companies do not produce new varieties and inputs entirely on their own research.
B. that almost all technological improvements are based on knowledge and experience accumulated from the past.
C. the complementary role of public-and private-sector research.
D. that knowledge repositories are primarily the scientific community and its academic publications.

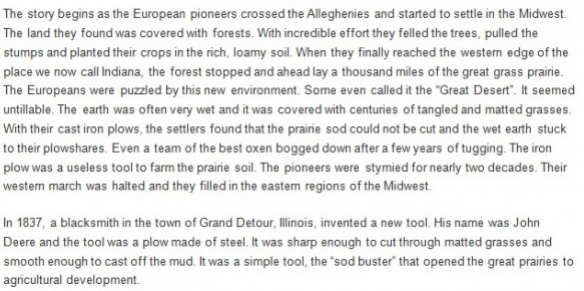
## 5.16.26 Passage Reading: CAT 2000 | Question: 30 top

**The passage given below is followed by a question. Choose the best answer.**



The story begins as the European pioneers crossed the Alleghenies and started to settle in the Midwest. The land they found was covered with forests. With incredible effort they felled the trees, pulled the stumps and planted their crops in the rich, loamy soil. When they finally reached the western edge of the place we now call Indiana, the forest stopped and ahead lay a thousand miles of the great grass prairie. The Europeans were puzzled by this new environment. Some even called it the "Great Desert". It seemed untillable. The earth was often very wet and it was covered with centuries of tangled and matted grasses. With their cast iron plows, the settlers found that the prairie sod could not be cut and the wet earth stuck to their plowshares. Even a team of the best oxen bogged down after a few years of tugging. The iron plow was a useless tool to farm the prairie soil. The pioneers were stymied for nearly two decades. Their western march was halted and they filled in the eastern regions of the Midwest.

In 1837, a blacksmith in the town of Grand Detour, Illinois, invented a new tool. His name was John Deere and the tool was a plow made of steel. It was sharp enough to cut through matted grasses and smooth enough to cast off the mud. It was a simple tool, the "sod buster" that opened the great prairies to agricultural development.

Sauk County, Wisconsin is the part of that prairie where I have a home. It is named after the Sauk Indians. In 1673, Father Marquette was the first European to lay his eyes upon their land. He found a village laid out in regular patterns on a plain beside the Wisconsin River. He called the place Prairie du Sac. The village was surrounded by fields that had provided maize, beans and squash for the Sauk people for generations reaching back into the unrecorded time.

When the European settlers arrived at the Sauk prairie in 1837, the government forced the native Sauk people west of the Mississippi River. The settlers came with John Deere's new invention and used the tool to open the area to a new kind of agriculture. They ignored the traditional ways of the Sauk Indians and used their sod-busting tool for planting wheat. Initially, the soil was generous and the farmers thrived. However, each year the soil lost more of its nurturing power. It was only thirty years after the Europeans arrived with their new technology that the land was depleted. Wheat farming became uneconomic and tens of thousands of farmers left Wisconsin seeking new land with sod to bust.

It took the Europeans and their new technology just one generation to make their homeland into a desert. The Sauk Indians who knew how to sustain themselves on the Sauk prairie land were banished to another kind of desert called a reservation. And they even forgot about the techniques and tools that had sustained them on the prairie for generations unrecorded. And that is how it was that three deserts were created- Wisconsin, the reservation and the memories of a people. A century later, the land of the Sauks is now populated by the children of a second wave of European farmers who learned to replenish the soil through the regenerative powers of dairying, ground cover crops and animal manures. These third and fourth generation farmers and townspeople do not realise, however, that a new settler is coming soon with an invention as powerful as John Deere's plow.

The new technology is called 'bereavement counselling'. It is a tool forged at the great state university, an innovative technique to meet the needs of those experiencing the death of a loved one, a tool that can "process" the grief of the people who now live on the Prairie of the Sauk. As one can imagine the final days of the village of the Sauk Indians before the arrival of the settlers with John Deere's plow, one can also imagine these final days before the arrival of the first bereavement counsellor at Prairie du Sac. In these final days, the farmers and the townspeople mourn at the death of a mother, brother, son or friend. The bereaved is joined by neighbours and kin. They meet grief together in lamentation, prayer and song. They call upon the words of the clergy and surround themselves in community.

It is in these ways that they grieve and then go on with life. Through their mourning they are assured of the bonds between them and renewed in the knowledge that this death is a part of the Prairie of the Sauk. Their grief is common property, anguish from which the community draws strength and gives the bereaved the courage to move ahead.

It is into this prairie community that the bereavement counsellor arrives with the new grief technology. The counsellor calls the invention a service and assures the prairie folk of its effectiveness and superiority by invoking the name of the great university while displaying a diploma and certificate. At first, we can imagine that the local people will be puzzled by the bereavement counsellor's claim. However, the counsellor will tell a few of them that the new technique is merely to assist the bereaved's community at the time of death. To some other prairie folk who are isolated or forgotten, the counsellor will approach the County Board and advocate the right to treatment for these unfortunate souls. This right will be guaranteed by the Board's decision to reimburse those too poor to pay for counselling services. There will be others, schooled to believe in the innovative new tools certified by universities and medical centres, who will seek out the bereavement counsellor by force of habit. And one of these people will tell a bereaved neighbour who is unschooled that unless his grief is processed by a counsellor, he will probably have major psychological problems in later life. Several people will begin to use the bereavement counsellor because, since the County Board now taxes them to insure access to the technology, they will feel that to fail to be counselled is to waste their money, and to be denied a benefit, or even a right.

Finally, one day, the aged father of a Sauk woman will die. And the next door neighbour will not drop by because he doesn't want to interrupt the bereavement counsellor. The woman's kin will stay home because they will have learned that only the bereavement counsellor knows how to process grief the proper way. The local clergy will seek technical assistance from the bereavement counsellor to learn the correct form of service to deal with guilt and grief. And the grieving daughter will know that it is the bereavement counsellor who really cares for her because only the bereavement counsellor comes when death visits this family on the Prairie of the Sauk.

It will be only one generation between the bereavement counsellor arrives and the community of mourners disappears. The

counsellor's new tool will cut through the social fabric, throwing aside kinship, care, neighbourly obligations and community ways of coming together and going on. Like John Deere's plow, the tools of bereavement counselling will create a desert where a community once flourished. And finally, even the bereavement counsellor will see the impossibility of restoring hope in clients once they are genuinely alone with nothing but a service for consolation. In the inevitable failure of the service, the bereavement counsellor will find the deserts even in herself.

Which of the following does the 'desert' in the passage refer to?

A. Prairie soil depleted by cultivation of wheat.
B. Reservations in which native Indians were resettled.
C. Absence of, and emptiness in, community kinship and relationships.
D. All of the above.

## 5.16.27 Passage Reading: CAT 2000 | Question: 31 top

**The passage given below is followed by a question. Choose the best answer.**

The story begins as the European pioneers crossed the Alleghenies and started to settle in the Midwest. The land they found was covered with forests. With incredible effort they felled the trees, pulled the stumps and planted their crops in the rich, loamy soil. When they finally reached the western edge of the place we now call Indiana, the forest stopped and ahead lay a thousand miles of the great grass prairie. The Europeans were puzzled by this new environment. Some even called it the "Great Desert". It seemed untillable. The earth was often very wet and it was covered with centuries of tangled and matted grasses. With their cast iron plows, the settlers found that the prairie sod could not be cut and the wet earth stuck to their plowshares. Even a team of the best oxen bogged down after a few years of tugging. The iron plow was a useless tool to farm the prairie soil. The pioneers were stymied for nearly two decades. Their western march was halted and they filled in the eastern regions of the Midwest.

In 1837, a blacksmith in the town of Grand Detour, Illinois, invented a new tool. His name was John Deere and the tool was a plow made of steel. It was sharp enough to cut through matted grasses and smooth enough to cast off the mud. It was a simple tool, the "sod buster" that opened the great prairies to agricultural development.

Sauk County, Wisconsin is the part of that prairie where I have a home. It is named after the Sauk Indians. In 1673, Father Marquette was the first European to lay his eyes upon their land. He found a village laid out in regular patterns on a plain beside the Wisconsin River. He called the place Prairie du Sac. The village was surrounded by fields that had provided maize, beans and squash for the Sauk people for generations reaching back into the unrecorded time.

When the European settlers arrived at the Sauk prairie in 1837, the government forced the native Sauk people west of the Mississippi River. The settlers came with John Deere's new invention and used the tool to open the area to a new kind of agriculture. They ignored the traditional ways of the Sauk Indians and used their sod-busting tool for planting wheat. Initially, the soil was generous and the farmers thrived. However, each year the soil lost more of its nurturing power. It was only thirty years after the Europeans arrived with their new technology that the land was depleted. Wheat farming became uneconomic and tens of thousands of farmers left Wisconsin seeking new land with sod to bust.

It took the Europeans and their new technology just one generation to make their homeland into a desert. The Sauk Indians who knew how to sustain themselves on the Sauk prairie land were banished to another kind of desert called a reservation. And they even forgot about the techniques and tools that had sustained them on the prairie for generations unrecorded. And that is how it was that three deserts were created- Wisconsin, the reservation and the memories of a people. A century later, the land of the Sauks is now populated by the children of a second wave of European farmers who learned to replenish the soil through the regenerative powers of dairying, ground cover crops and animal manures. These third and fourth generation farmers and townspeople do not realise, however, that a new settler is coming soon with an invention as powerful as John Deere's plow.

The new technology is called 'bereavement counselling'. It is a tool forged at the great state university, an innovative technique to meet the needs of those experiencing the death of a loved one, a tool that can "process" the grief of the people who now live on the Prairie of the Sauk. As one can imagine the final days of the village of the Sauk Indians before the arrival of the settlers with John Deere's plow, one can also imagine these final days before the arrival of the first bereavement counsellor at Prairie du Sac. In these final days, the farmers and the townspeople mourn at the death of a mother, brother, son or friend. The bereaved is joined by neighbours and kin. They meet grief together in lamentation, prayer and song. They call upon the words of the clergy and surround themselves in community.

It is in these ways that they grieve and then go on with life. Through their mourning they are assured of the bonds between them and renewed in the knowledge that this death is a part of the Prairie of the Sauk. Their grief is common property, anguish from which the community draws strength and gives the bereaved the courage to move ahead.

It is into this prairie community that the bereavement counsellor arrives with the new grief technology. The counsellor calls the invention a service and assures the prairie folk of its effectiveness and superiority by invoking the name of the great university while displaying a diploma and certificate. At first, we can imagine that the local people will be puzzled by the bereavement counsellor's claim. However, the counsellor will tell a few of them that the new technique is merely to assist the bereaved's community at the time of death. To some other prairie folk who are isolated or forgotten, the counsellor will approach the County Board and advocate the right to treatment for these unfortunate souls. This right will be guaranteed by the Board's decision to reimburse those too poor to pay for counselling services. There will be others, schooled to believe in the innovative

new tools certified by universities and medical centres, who will seek out the bereavement counsellor by force of habit. And one of these people will tell a bereaved neighbour who is unschooled that unless his grief is processed by a counsellor, he will probably have major psychological problems in later life. Several people will begin to use the bereavement counsellor because, since the County Board now taxes them to insure access to the technology, they will feel that to fail to be counselled is to waste their money, and to be denied a benefit, or even a right.

Finally, one day, the aged father of a Sauk woman will die. And the next door neighbour will not drop by because he doesn't want to interrupt the bereavement counsellor. The woman's kin will stay home because they will have learned that only the bereavement counsellor knows how to process grief the proper way. The local clergy will seek technical assistance from the bereavement counsellor to learn the correct form of service to deal with guilt and grief. And the grieving daughter will know that it is the bereavement counsellor who really cares for her because only the bereavement counsellor comes when death visits this family on the Prairie of the Sauk.

It will be only one generation between the bereavement counsellor arrives and the community of mourners disappears. The counsellor's new tool will cut through the social fabric, throwing aside kinship, care, neighbourly obligations and community ways of coming together and going on. Like John Deere's plow, the tools of bereavement counselling will create a desert where a community once flourished. And finally, even the bereavement counsellor will see the impossibility of restoring hope in clients once they are genuinely alone with nothing but a service for consolation. In the inevitable failure of the service, the bereavement counsellor will find the deserts even in herself.

According to the author, people will begin to utilise the service of the bereavement counsellor because

A. new County regulations will make them feel it is a right, and if they don't use it, it would be a loss.
B. the bereaved in the community would find her a helpful friend.
C. she will fight for subsistence allowance from the County Board for the poor among the bereaved.
D. grief processing needs tools certified by universities and medical centres.

## 5.16.28 Passage Reading: CAT 2000 | Question: 32 top

**The passage given below is followed by a question. Choose the best answer.**

The story begins as the European pioneers crossed the Alleghenies and started to settle in the Midwest. The land they found was covered with forests. With incredible effort they felled the trees, pulled the stumps and planted their crops in the rich, loamy soil. When they finally reached the western edge of the place we now call Indiana, the forest stopped and ahead lay a thousand miles of the great grass prairie. The Europeans were puzzled by this new environment. Some even called it the "Great Desert". It seemed untillable. The earth was often very wet and it was covered with centuries of tangled and matted grasses. With their cast iron plows, the settlers found that the prairie sod could not be cut and the wet earth stuck to their plowshares. Even a team of the best oxen bogged down after a few years of tugging. The iron plow was a useless tool to farm the prairie soil. The pioneers were stymied for nearly two decades. Their western march was halted and they filled in the eastern regions of the Midwest.

In 1837, a blacksmith in the town of Grand Detour, Illinois, invented a new tool. His name was John Deere and the tool was a plow made of steel. It was sharp enough to cut through matted grasses and smooth enough to cast off the mud. It was a simple tool, the "sod buster" that opened the great prairies to agricultural development.

Sauk County, Wisconsin is the part of that prairie where I have a home. It is named after the Sauk Indians. In 1673, Father Marquette was the first European to lay his eyes upon their land. He found a village laid out in regular patterns on a plain beside the Wisconsin River. He called the place Prairie du Sac. The village was surrounded by fields that had provided maize, beans and squash for the Sauk people for generations reaching back into the unrecorded time.

When the European settlers arrived at the Sauk prairie in 1837, the government forced the native Sauk people west of the Mississippi River. The settlers came with John Deere's new invention and used the tool to open the area to a new kind of agriculture. They ignored the traditional ways of the Sauk Indians and used their sod-busting tool for planting wheat. Initially, the soil was generous and the farmers thrived. However, each year the soil lost more of its nurturing power. It was only thirty years after the Europeans arrived with their new technology that the land was depleted. Wheat farming became uneconomic and tens of thousands of farmers left Wisconsin seeking new land with sod to bust.

It took the Europeans and their new technology just one generation to make their homeland into a desert. The Sauk Indians who knew how to sustain themselves on the Sauk prairie land were banished to another kind of desert called a reservation. And they even forgot about the techniques and tools that had sustained them on the prairie for generations unrecorded. And that is how it was that three deserts were created- Wisconsin, the reservation and the memories of a people. A century later, the land of the Sauks is now populated by the children of a second wave of European farmers who learned to replenish the soil through the regenerative powers of dairying, ground cover crops and animal manures. These third and fourth generation farmers and townspeople do not realise, however, that a new settler is coming soon with an invention as powerful as John Deere's plow.

The new technology is called 'bereavement counselling'. It is a tool forged at the great state university, an innovative technique to meet the needs of those experiencing the death of a loved one, a tool that can "process" the grief of the people who now live on the Prairie of the Sauk. As one can imagine the final days of the village of the Sauk Indians before the arrival of the settlers with John Deere's plow, one can also imagine these final days before the arrival of the first bereavement counsellor at Prairie du Sac. In these final days, the farmers and the townspeople mourn at the death of a mother, brother, son or friend. The

bereaved is joined by neighbours and kin. They meet grief together in lamentation, prayer and song. They call upon the words of the clergy and surround themselves in community.

It is in these ways that they grieve and then go on with life. Through their mourning they are assured of the bonds between them and renewed in the knowledge that this death is a part of the Prairie of the Sauk. Their grief is common property, anguish from which the community draws strength and gives the bereaved the courage to move ahead.

It is into this prairie community that the bereavement counsellor arrives with the new grief technology. The counsellor calls the invention a service and assures the prairie folk of its effectiveness and superiority by invoking the name of the great university while displaying a diploma and certificate. At first, we can imagine that the local people will be puzzled by the bereavement counsellor's claim. However, the counsellor will tell a few of them that the new technique is merely to assist the bereaved's community at the time of death. To some other prairie folk who are isolated or forgotten, the counsellor will approach the County Board and advocate the right to treatment for these unfortunate souls. This right will be guaranteed by the Board's decision to reimburse those too poor to pay for counselling services. There will be others, schooled to believe in the innovative new tools certified by universities and medical centres, who will seek out the bereavement counsellor by force of habit. And one of these people will tell a bereaved neighbour who is unschooled that unless his grief is processed by a counsellor, he will probably have major psychological problems in later life. Several people will begin to use the bereavement counsellor because, since the County Board now taxes them to insure access to the technology, they will feel that to fail to be counselled is to waste their money, and to be denied a benefit, or even a right.

Finally, one day, the aged father of a Sauk woman will die. And the next door neighbour will not drop by because he doesn't want to interrupt the bereavement counsellor. The woman's kin will stay home because they will have learned that only the bereavement counsellor knows how to process grief the proper way. The local clergy will seek technical assistance from the bereavement counsellor to learn the correct form of service to deal with guilt and grief. And the grieving daughter will know that it is the bereavement counsellor who really cares for her because only the bereavement counsellor comes when death visits this family on the Prairie of the Sauk.

It will be only one generation between the bereavement counsellor arrives and the community of mourners disappears. The counsellor's new tool will cut through the social fabric, throwing aside kinship, care, neighbourly obligations and community ways of coming together and going on. Like John Deere's plow, the tools of bereavement counselling will create a desert where a community once flourished. And finally, even the bereavement counsellor will see the impossibility of restoring hope in clients once they are genuinely alone with nothing but a service for consolation. In the inevitable failure of the service, the bereavement counsellor will find the deserts even in herself.

Which one of the following parallels between the plow and bereavement counselling is not claimed by the author?

A. Both are innovative technologies.
B. Both result in migration of the communities into which the innovations are introduced.
C. Both lead to 'deserts' in the space of only one generation.
D. Both are tools introduced by outsiders entering existing communities.

cat2000 verbal-ability passage-reading

## 5.16.29 Passage Reading: CAT 2000 | Question: 33 top

**The passage given below is followed by a question. Choose the best answer.**

The teaching and transmission of North Indian classical music is, and long has been, achieved by largely oral means. The raga and its structure, the often breathtaking intricacies of tala or rhythm, and the incarnation of raga and tala as bandish or composition, are passed thus, between guru and shishya by word of mouth and direct demonstration, with no printed sheet of notated music, as it were, acting as a go-between. Saussure's conception of language as a communication between addresser and addressee is given, in this model, a further instance, and a new exotic complexity and glamour.

These days, especially with the middle class having entered the domain of classical music and playing not a small part in ensuring the continuation of this ancient tradition, the tape recorder serves as a handy technological slave and preserves, from oblivion, the vanishing, elusive moment of oral transmission. Hoary gurus, too, have seen the advantage of this device, and increasingly use it as an aid to instructing their pupils; in place of the shawls and other traditional objects that used to pass from shishya to guru in the past, as a token of the regard of the former for the latter, it is not unusual, today, to see cassettes changing hands.

Part of my education in North Indian classical music was conducted via this rather ugly but beneficial rectangle of plastic, which I carried with me to England when I was an undergraduate. One cassette had stored in it various talas played upon the tabla, at various tempos, by my music teacher's brother-inlaw, Hazarilalji, who was a teacher of Kathak dance, as well as a singer and a tabla player. This was a work of great patience and prescience, a one-and-a-half hour performance without any immediate point or purpose, but intended for some delayed future moment when I'd practise the talas solitarily.

This repeated playing out of the rhythmic cycles on the tabla was inflected by the noises- an irate auto driver blowing a horn; the sound of overbearing pigeons that were such a nuisance on the banister; even the cry of a kulfi seller in summer- entering from the balcony of the third floor flat we occupied in those days, in a lane in a Bombay suburb, before we left the city for good. These sounds, in turn, would invade, hesitantly, the ebb and flow of silence inside the artificially heated room, in a

borough of West London, in which I used to live as an undergraduate. There, in the trapped dust, silence and heat, the theka of the tabla, qualified by the imminent but intermittent presence of the Bombay suburb, would come to life again. A few years later, the tabla and, in the background, the pigeons and the itinerant kulfi seller, would inhabit a small graduate room in Oxford.

The tape recorder, though, remains an extension of the oral transmission of music, rather than a replacement of it. And the oral transmission of North Indian classical music remains, almost uniquely, a testament to the fact that the human brain can absorb, remember and reproduce structures of great complexity and sophistication without the help of the hieroglyph or written mark or a system of notation. I remember my surprise on discovering that Hazarilalji-who had mastered Kathak dance, tala and North Indian classical music, and who used to narrate to me, occasionally, compositions meant for dance that were grand and intricate in their verbal prosody, architecture and rhythmic complexity- was near illiterate and had barely learnt to write his name in large and clumsy letters.

Of course, attempts have been made, throughout the 20th century, to formally codify and even notate this music, and institutions set up and degrees created, specifically to educate students in this "scientific" and codified manner. Paradoxically, however, this style of teaching has produced no noteworthy student or performer; the most creative musicians still emerge from the guru-shishya relationship, their understanding of music developed by oral communication.

The fact that North Indian classical music emanates from, and has evolved through, oral culture, means that this music has a significantly different aesthetic, and that this aesthetic has a different politics, from that of Western classical music. A piece of music in the Western tradition, at least in its most characteristic and popular conception, originates in its composer, and the connection between the two, between composer and the piece of music, is relatively unambiguous precisely because the composer writes down, in notation, his composition, as a poet might write down and publish his poem. However far the printed sheet of notated music might travel thus from the composer, it still remains his property; and the notion of property remains at the heart of the Western conception of "genius", which derives from the Latin gignere or 'to beget'.

The genius in Western classical music is, then, the originator, begetter and owner of his work-the printed, notated sheet testifying to his authority over his product and his power, not only of expression or imagination, but of origination. The conductor is a custodian and guardian of this property. Is it an TF-MS-PP-01-0109 15 © www.TestFunda.com accident that Mandelstam, in his notebooks, compares- celebratorily- the conductor's baton to a policeman's, saying all the music of the orchestra lies mute within it, waiting for its first movement to release it into the auditorium?

The raga-transmitted through oral means is, in a sense, no one's property; it is not easy to pin down its source, or to know exactly where its provenance or origin lies. Unlike the Western classical tradition, where the composer begets his piece, notates it and stamps it with his ownership and remains, in effect, larger than, or the father of, his work, in the North Indian classical tradition, the raga-unconfined to a single incarnation, composer or performer-remains necessarily greater than the artiste who invokes it.

This leads to a very different politics of interpretation and valuation, to an aesthetic that privileges the evanescent moment of performance and invocation over the controlling authority of genius and the permanent record. It is a tradition, thus, that would appear to value the performer, as medium, more highly than the composer who presumes to originate what, effectively, cannot be originated in a single person- because the raga is the inheritance of a culture.

The author's contention that the notion of property lies at the heart of the Western conception of genius is best indicated by which one of the following?

A. The creative output of a genius is invariably written down and recorded.
B. The link between the creator and his output is unambiguous.
C. The word "genius" is derived from a Latin word which means "to beget."
D. The music composer notates his music and thus becomes the "father" of a particular piece of music.

## 5.16.30 Passage Reading: CAT 2000 | Question: 34 top

**The passage given below is followed by a question. Choose the best answer.**

The teaching and transmission of North Indian classical music is, and long has been, achieved by largely oral means. The raga and its structure, the often breathtaking intricacies of tala or rhythm, and the incarnation of raga and tala as bandish or composition, are passed thus, between guru and shishya by word of mouth and direct demonstration, with no printed sheet of notated music, as it were, acting as a go-between. Saussure's conception of language as a communication between addresser and addressee is given, in this model, a further instance, and a new exotic complexity and glamour.

These days, especially with the middle class having entered the domain of classical music and playing not a small part in ensuring the continuation of this ancient tradition, the tape recorder serves as a handy technological slave and preserves, from oblivion, the vanishing, elusive moment of oral transmission. Hoary gurus, too, have seen the advantage of this device, and increasingly use it as an aid to instructing their pupils; in place of the shawls and other traditional objects that used to pass from shishya to guru in the past, as a token of the regard of the former for the latter, it is not unusual, today, to see cassettes changing hands.

Part of my education in North Indian classical music was conducted via this rather ugly but beneficial rectangle of plastic, which I carried with me to England when I was an undergraduate. One cassette had stored in it various talas played upon the

tabla, at various tempos, by my music teacher's brother-inlaw, Hazarilalji, who was a teacher of Kathak dance, as well as a singer and a tabla player. This was a work of great patience and prescience, a one-and-a-half hour performance without any immediate point or purpose, but intended for some delayed future moment when I'd practise the talas solitarily.

This repeated playing out of the rhythmic cycles on the tabla was inflected by the noises- an irate auto driver blowing a horn; the sound of overbearing pigeons that were such a nuisance on the banister; even the cry of a kulfi seller in summer- entering from the balcony of the third floor flat we occupied in those days, in a lane in a Bombay suburb, before we left the city for good. These sounds, in turn, would invade, hesitantly, the ebb and flow of silence inside the artificially heated room, in a borough of West London, in which I used to live as an undergraduate. There, in the trapped dust, silence and heat, the theka of the tabla, qualified by the imminent but intermittent presence of the Bombay suburb, would come to life again. A few years later, the tabla and, in the background, the pigeons and the itinerant kulfi seller, would inhabit a small graduate room in Oxford.

The tape recorder, though, remains an extension of the oral transmission of music, rather than a replacement of it. And the oral transmission of North Indian classical music remains, almost uniquely, a testament to the fact that the human brain can absorb, remember and reproduce structures of great complexity and sophistication without the help of the hieroglyph or written mark or a system of notation. I remember my surprise on discovering that Hazarilalji-who had mastered Kathak dance, tala and North Indian classical music, and who used to narrate to me, occasionally, compositions meant for dance that were grand and intricate in their verbal prosody, architecture and rhythmic complexity- was near illiterate and had barely learnt to write his name in large and clumsy letters.

Of course, attempts have been made, throughout the 20th century, to formally codify and even notate this music, and institutions set up and degrees created, specifically to educate students in this "scientific" and codified manner. Paradoxically, however, this style of teaching has produced no noteworthy student or performer; the most creative musicians still emerge from the guru-shishya relationship, their understanding of music developed by oral communication.

The fact that North Indian classical music emanates from, and has evolved through, oral culture, means that this music has a significantly different aesthetic, and that this aesthetic has a different politics, from that of Western classical music. A piece of music in the Western tradition, at least in its most characteristic and popular conception, originates in its composer, and the connection between the two, between composer and the piece of music, is relatively unambiguous precisely because the composer writes down, in notation, his composition, as a poet might write down and publish his poem. However far the printed sheet of notated music might travel thus from the composer, it still remains his property; and the notion of property remains at the heart of the Western conception of "genius", which derives from the Latin gignere or 'to beget'.

The genius in Western classical music is, then, the originator, begetter and owner of his work-the printed, notated sheet testifying to his authority over his product and his power, not only of expression or imagination, but of origination. The conductor is a custodian and guardian of this property. Is it an TF-MS-PP-01-0109 15 © www.TestFunda.com accident that Mandelstam, in his notebooks, compares- celebratorily- the conductor's baton to a policeman's, saying all the music of the orchestra lies mute within it, waiting for its first movement to release it into the auditorium?

The raga-transmitted through oral means is, in a sense, no one's property; it is not easy to pin down its source, or to know exactly where its provenance or origin lies. Unlike the Western classical tradition, where the composer begets his piece, notates it and stamps it with his ownership and remains, in effect, larger than, or the father of, his work, in the North Indian classical tradition, the raga-unconfined to a single incarnation, composer or performer-remains necessarily greater than the artiste who invokes it.

This leads to a very different politics of interpretation and valuation, to an aesthetic that privileges the evanescent moment of performance and invocation over the controlling authority of genius and the permanent record. It is a tradition, thus, that would appear to value the performer, as medium, more highly than the composer who presumes to originate what, effectively, cannot be originated in a single person- because the raga is the inheritance of a culture.

Saussure's conception of language as a communication between addresser and addressee, according to the author, is exemplified by the

A. teaching of North Indian classical music by word of mouth and direct demonstration.
B. use of the recorded cassette as a transmission medium between the music teacher and the trainee.
C. written down notation sheets of musical compositions.
D. conductor's baton and the orchestra.

## 5.16.31 Passage Reading: CAT 2000 | Question: 35 top

**The passage given below is followed by a question. Choose the best answer.**

The teaching and transmission of North Indian classical music is, and long has been, achieved by largely oral means. The raga and its structure, the often breathtaking intricacies of tala or rhythm, and the incarnation of raga and tala as bandish or composition, are passed thus, between guru and shishya by word of mouth and direct demonstration, with no printed sheet of notated music, as it were, acting as a go-between. Saussure's conception of language as a communication between addresser and addressee is given, in this model, a further instance, and a new exotic complexity and glamour.

These days, especially with the middle class having entered the domain of classical music and playing not a small part in

ensuring the continuation of this ancient tradition, the tape recorder serves as a handy technological slave and preserves, from oblivion, the vanishing, elusive moment of oral transmission. Hoary gurus, too, have seen the advantage of this device, and increasingly use it as an aid to instructing their pupils; in place of the shawls and other traditional objects that used to pass from shishya to guru in the past, as a token of the regard of the former for the latter, it is not unusual, today, to see cassettes changing hands.

Part of my education in North Indian classical music was conducted via this rather ugly but beneficial rectangle of plastic, which I carried with me to England when I was an undergraduate. One cassette had stored in it various talas played upon the tabla, at various tempos, by my music teacher's brother-inlaw, Hazarilalji, who was a teacher of Kathak dance, as well as a singer and a tabla player. This was a work of great patience and prescience, a one-and-a-half hour performance without any immediate point or purpose, but intended for some delayed future moment when I'd practise the talas solitarily.

This repeated playing out of the rhythmic cycles on the tabla was inflected by the noises- an irate auto driver blowing a horn; the sound of overbearing pigeons that were such a nuisance on the banister; even the cry of a kulfi seller in summer- entering from the balcony of the third floor flat we occupied in those days, in a lane in a Bombay suburb, before we left the city for good. These sounds, in turn, would invade, hesitantly, the ebb and flow of silence inside the artificially heated room, in a borough of West London, in which I used to live as an undergraduate. There, in the trapped dust, silence and heat, the theka of the tabla, qualified by the imminent but intermittent presence of the Bombay suburb, would come to life again. A few years later, the tabla and, in the background, the pigeons and the itinerant kulfi seller, would inhabit a small graduate room in Oxford.

The tape recorder, though, remains an extension of the oral transmission of music, rather than a replacement of it. And the oral transmission of North Indian classical music remains, almost uniquely, a testament to the fact that the human brain can absorb, remember and reproduce structures of great complexity and sophistication without the help of the hieroglyph or written mark or a system of notation. I remember my surprise on discovering that Hazarilalji-who had mastered Kathak dance, tala and North Indian classical music, and who used to narrate to me, occasionally, compositions meant for dance that were grand and intricate in their verbal prosody, architecture and rhythmic complexity- was near illiterate and had barely learnt to write his name in large and clumsy letters.

Of course, attempts have been made, throughout the 20th century, to formally codify and even notate this music, and institutions set up and degrees created, specifically to educate students in this "scientific" and codified manner. Paradoxically, however, this style of teaching has produced no noteworthy student or performer; the most creative musicians still emerge from the guru-shishya relationship, their understanding of music developed by oral communication.

The fact that North Indian classical music emanates from, and has evolved through, oral culture, means that this music has a significantly different aesthetic, and that this aesthetic has a different politics, from that of Western classical music. A piece of music in the Western tradition, at least in its most characteristic and popular conception, originates in its composer, and the connection between the two, between composer and the piece of music, is relatively unambiguous precisely because the composer writes down, in notation, his composition, as a poet might write down and publish his poem. However far the printed sheet of notated music might travel thus from the composer, it still remains his property; and the notion of property remains at the heart of the Western conception of "genius", which derives from the Latin gignere or 'to beget'.

The genius in Western classical music is, then, the originator, begetter and owner of his work-the printed, notated sheet testifying to his authority over his product and his power, not only of expression or imagination, but of origination. The conductor is a custodian and guardian of this property. Is it an TF-MS-PP-01-0109 15 © www.TestFunda.com accident that Mandelstam, in his notebooks, compares- celebratorily- the conductor's baton to a policeman's, saying all the music of the orchestra lies mute within it, waiting for its first movement to release it into the auditorium?

The raga-transmitted through oral means is, in a sense, no one's property; it is not easy to pin down its source, or to know exactly where its provenance or origin lies. Unlike the Western classical tradition, where the composer begets his piece, notates it and stamps it with his ownership and remains, in effect, larger than, or the father of, his work, in the North Indian classical tradition, the raga-unconfined to a single incarnation, composer or performer-remains necessarily greater than the artiste who invokes it.

This leads to a very different politics of interpretation and valuation, to an aesthetic that privileges the evanescent moment of performance and invocation over the controlling authority of genius and the permanent record. It is a tradition, thus, that would appear to value the performer, as medium, more highly than the composer who presumes to originate what, effectively, cannot be originated in a single person- because the raga is the inheritance of a culture.

The author holds that the "rather ugly but beneficial rectangle of plastic" has proved to be a "handy technological slave" in

A. storing the talas played upon the tabla, at various tempos.
B. ensuring the continuance of an ancient tradition.
C. transporting North Indian classical music across geographical borders.
D. capturing the transient moment of oral transmission.

It is a tradition, thus, that would appear to value the performer, as medium, more highly than the composer who presumes to originate what, effectively, cannot be originated in a single person- because the raga is the inheritance of a culture.

The oral transmission of North Indian classical music is an almost unique testament of the

A. efficacy of the guru-shishya tradition.
B. earning impact of direct demonstration.
C. brain's ability to reproduce complex structures without the help of written marks.
D. the ability of an illiterate person to narrate grand and intricate musical compositions

cat2000 verbal-ability passage-reading

## 5.16.33 Passage Reading: CAT 2000 | Question: 37 top

**The passage given below is followed by a question. Choose the best answer.**

The teaching and transmission of North Indian classical music is, and long has been, achieved by largely oral means. The raga and its structure, the often breathtaking intricacies of tala or rhythm, and the incarnation of raga and tala as bandish or composition, are passed thus, between guru and shishya by word of mouth and direct demonstration, with no printed sheet of notated music, as it were, acting as a go-between. Saussure's conception of language as a communication between addresser and addressee is given, in this model, a further instance, and a new exotic complexity and glamour.

These days, especially with the middle class having entered the domain of classical music and playing not a small part in ensuring the continuation of this ancient tradition, the tape recorder serves as a handy technological slave and preserves, from oblivion, the vanishing, elusive moment of oral transmission. Hoary gurus, too, have seen the advantage of this device, and increasingly use it as an aid to instructing their pupils; in place of the shawls and other traditional objects that used to pass from shishya to guru in the past, as a token of the regard of the former for the latter, it is not unusual, today, to see cassettes changing hands.

Part of my education in North Indian classical music was conducted via this rather ugly but beneficial rectangle of plastic, which I carried with me to England when I was an undergraduate. One cassette had stored in it various talas played upon the tabla, at various tempos, by my music teacher's brother-inlaw, Hazarilalji, who was a teacher of Kathak dance, as well as a singer and a tabla player. This was a work of great patience and prescience, a one-and-a-half hour performance without any immediate point or purpose, but intended for some delayed future moment when I'd practise the talas solitarily.

This repeated playing out of the rhythmic cycles on the tabla was inflected by the noises- an irate auto driver blowing a horn; the sound of overbearing pigeons that were such a nuisance on the banister; even the cry of a kulfi seller in summer- entering from the balcony of the third floor flat we occupied in those days, in a lane in a Bombay suburb, before we left the city for good. These sounds, in turn, would invade, hesitantly, the ebb and flow of silence inside the artificially heated room, in a borough of West London, in which I used to live as an undergraduate. There, in the trapped dust, silence and heat, the theka of the tabla, qualified by the imminent but intermittent presence of the Bombay suburb, would come to life again. A few years later, the tabla and, in the background, the pigeons and the itinerant kulfi seller, would inhabit a small graduate room in Oxford.

The tape recorder, though, remains an extension of the oral transmission of music, rather than a replacement of it. And the oral transmission of North Indian classical music remains, almost uniquely, a testament to the fact that the human brain can absorb, remember and reproduce structures of great complexity and sophistication without the help of the hieroglyph or written mark or a system of notation. I remember my surprise on discovering that Hazarilalji-who had mastered Kathak dance, tala and North Indian classical music, and who used to narrate to me, occasionally, compositions meant for dance that were grand and intricate in their verbal prosody, architecture and rhythmic complexity- was near illiterate and had barely learnt to write his name in large and clumsy letters.

Of course, attempts have been made, throughout the 20th century, to formally codify and even notate this music, and institutions set up and degrees created, specifically to educate students in this "scientific" and codified manner. Paradoxically, however, this style of teaching has produced no noteworthy student or performer; the most creative musicians still emerge from the guru-shishya relationship, their understanding of music developed by oral communication.

The fact that North Indian classical music emanates from, and has evolved through, oral culture, means that this music has a significantly different aesthetic, and that this aesthetic has a different politics, from that of Western classical music. A piece of music in the Western tradition, at least in its most characteristic and popular conception, originates in its composer, and the connection between the two, between composer and the piece of music, is relatively unambiguous precisely because the composer writes down, in notation, his composition, as a poet might write down and publish his poem. However far the printed sheet of notated music might travel thus from the composer, it still remains his property; and the notion of property remains at the heart of the Western conception of "genius", which derives from the Latin gignere or 'to beget'.

The genius in Western classical music is, then, the originator, begetter and owner of his work-the printed, notated sheet testifying to his authority over his product and his power, not only of expression or imagination, but of origination. The conductor is a custodian and guardian of this property. Is it an TF-MS-PP-01-0109 15 © www.TestFunda.com accident that Mandelstam, in his notebooks, compares- celebratorily- the conductor's baton to a policeman's, saying all the music of the orchestra lies mute within it, waiting for its first movement to release it into the auditorium?

The raga-transmitted through oral means is, in a sense, no one's property; it is not easy to pin down its source, or to know exactly where its provenance or origin lies. Unlike the Western classical tradition, where the composer begets his piece, notates it and stamps it with his ownership and remains, in effect, larger than, or the father of, his work, in the North Indian classical tradition, the raga-unconfined to a single incarnation, composer or performer-remains necessarily greater than the artiste who invokes it.

This leads to a very different politics of interpretation and valuation, to an aesthetic that privileges the evanescent moment of performance and invocation over the controlling authority of genius and the permanent record. It is a tradition, thus, that would appear to value the performer, as medium, more highly than the composer who presumes to originate what, effectively, cannot be originated in a single person- because the raga is the inheritance of a culture.

According to the passage, in the North Indian classical tradition, the raga remains greater than the artiste who invokes it. This implies an aesthetic which

A. emphasises performance and invocation over the authority of genius and permanent record.
B. makes the music no one's property.
C. values the composer more highly than the performer.
D. supports oral transmission of traditional music.

cat2000 verbal-ability passage-reading

## 5.16.34 Passage Reading: CAT 2000 | Question: 38 top

**The passage given below is followed by a question. Choose the best answer.**

The teaching and transmission of North Indian classical music is, and long has been, achieved by largely oral means. The raga and its structure, the often breathtaking intricacies of tala or rhythm, and the incarnation of raga and tala as bandish or composition, are passed thus, between guru and shishya by word of mouth and direct demonstration, with no printed sheet of notated music, as it were, acting as a go-between. Saussure's conception of language as a communication between addresser and addressee is given, in this model, a further instance, and a new exotic complexity and glamour.

These days, especially with the middle class having entered the domain of classical music and playing not a small part in ensuring the continuation of this ancient tradition, the tape recorder serves as a handy technological slave and preserves, from oblivion, the vanishing, elusive moment of oral transmission. Hoary gurus, too, have seen the advantage of this device, and increasingly use it as an aid to instructing their pupils; in place of the shawls and other traditional objects that used to pass from shishya to guru in the past, as a token of the regard of the former for the latter, it is not unusual, today, to see cassettes changing hands.

Part of my education in North Indian classical music was conducted via this rather ugly but beneficial rectangle of plastic, which I carried with me to England when I was an undergraduate. One cassette had stored in it various talas played upon the tabla, at various tempos, by my music teacher's brother-inlaw, Hazarilalji, who was a teacher of Kathak dance, as well as a singer and a tabla player. This was a work of great patience and prescience, a one-and-a-half hour performance without any immediate point or purpose, but intended for some delayed future moment when I'd practise the talas solitarily.

This repeated playing out of the rhythmic cycles on the tabla was inflected by the noises- an irate auto driver blowing a horn; the sound of overbearing pigeons that were such a nuisance on the banister; even the cry of a kulfi seller in summer- entering from the balcony of the third floor flat we occupied in those days, in a lane in a Bombay suburb, before we left the city for good. These sounds, in turn, would invade, hesitantly, the ebb and flow of silence inside the artificially heated room, in a borough of West London, in which I used to live as an undergraduate. There, in the trapped dust, silence and heat, the theka of the tabla, qualified by the imminent but intermittent presence of the Bombay suburb, would come to life again. A few years later, the tabla and, in the background, the pigeons and the itinerant kulfi seller, would inhabit a small graduate room in Oxford.

The tape recorder, though, remains an extension of the oral transmission of music, rather than a replacement of it. And the oral transmission of North Indian classical music remains, almost uniquely, a testament to the fact that the human brain can absorb, remember and reproduce structures of great complexity and sophistication without the help of the hieroglyph or written mark or a system of notation. I remember my surprise on discovering that Hazarilalji-who had mastered Kathak dance, tala and North Indian classical music, and who used to narrate to me, occasionally, compositions meant for dance that were grand and intricate in their verbal prosody, architecture and rhythmic complexity- was near illiterate and had barely learnt to write his name in large and clumsy letters.

Of course, attempts have been made, throughout the 20th century, to formally codify and even notate this music, and institutions set up and degrees created, specifically to educate students in this "scientific" and codified manner. Paradoxically, however, this style of teaching has produced no noteworthy student or performer; the most creative musicians still emerge from the guru-shishya relationship, their understanding of music developed by oral communication.

The fact that North Indian classical music emanates from, and has evolved through, oral culture, means that this music has a significantly different aesthetic, and that this aesthetic has a different politics, from that of Western classical music. A piece of music in the Western tradition, at least in its most characteristic and popular conception, originates in its composer, and the connection between the two, between composer and the piece of music, is relatively unambiguous precisely because the composer writes down, in notation, his composition, as a poet might write down and publish his poem. However far the printed sheet of notated music might travel thus from the composer, it still remains his property; and the notion of property remains at the heart of the Western conception of "genius", which derives from the Latin gignere or 'to beget'.

The genius in Western classical music is, then, the originator, begetter and owner of his work-the printed, notated sheet testifying to his authority over his product and his power, not only of expression or imagination, but of origination. The conductor is a custodian and guardian of this property. Is it an TF-MS-PP-01-0109 15 © www.TestFunda.com accident that Mandelstam, in his notebooks, compares- celebratorily- the conductor's baton to a policeman's, saying all the music of the orchestra lies mute within it, waiting for its first movement to release it into the auditorium?

The raga-transmitted through oral means is, in a sense, no one's property; it is not easy to pin down its source, or to know exactly where its provenance or origin lies. Unlike the Western classical tradition, where the composer begets his piece, notates

it and stamps it with his ownership and remains, in effect, larger than, or the father of, his work, in the North Indian classical tradition, the raga-unconfined to a single incarnation, composer or performer-remains necessarily greater than the artiste who invokes it.

This leads to a very different politics of interpretation and valuation, to an aesthetic that privileges the evanescent moment of performance and invocation over the controlling authority of genius and the permanent record. It is a tradition, thus, that would appear to value the performer, as medium, more highly than the composer who presumes to originate what, effectively, cannot be originated in a single person- because the raga is the inheritance of a culture.

From the author's explanation of the notion that in the Western tradition, music originates in its composer, which one of the following cannot be inferred?

A. It is easy to transfer a piece of Western classical music to a distant place.
B. The conductor in the Western tradition, as a custodian, can modify the music, since it 'lies mute' in his baton.
C. The authority of the Western classical music composer over his music product is unambiguous.
D. The power of the Western classical music composer extends to the expression of his music.

## 5.16.35 Passage Reading: CAT 2000 | Question: 39 top

**The passage given below is followed by a question. Choose the best answer.**

The teaching and transmission of North Indian classical music is, and long has been, achieved by largely oral means. The raga and its structure, the often breathtaking intricacies of tala or rhythm, and the incarnation of raga and tala as bandish or composition, are passed thus, between guru and shishya by word of mouth and direct demonstration, with no printed sheet of notated music, as it were, acting as a go-between. Saussure's conception of language as a communication between addresser and addressee is given, in this model, a further instance, and a new exotic complexity and glamour.

These days, especially with the middle class having entered the domain of classical music and playing not a small part in ensuring the continuation of this ancient tradition, the tape recorder serves as a handy technological slave and preserves, from oblivion, the vanishing, elusive moment of oral transmission. Hoary gurus, too, have seen the advantage of this device, and increasingly use it as an aid to instructing their pupils; in place of the shawls and other traditional objects that used to pass from shishya to guru in the past, as a token of the regard of the former for the latter, it is not unusual, today, to see cassettes changing hands.

Part of my education in North Indian classical music was conducted via this rather ugly but beneficial rectangle of plastic, which I carried with me to England when I was an undergraduate. One cassette had stored in it various talas played upon the tabla, at various tempos, by my music teacher's brother-inlaw, Hazarilalji, who was a teacher of Kathak dance, as well as a singer and a tabla player. This was a work of great patience and prescience, a one-and-a-half hour performance without any immediate point or purpose, but intended for some delayed future moment when I'd practise the talas solitarily.

This repeated playing out of the rhythmic cycles on the tabla was inflected by the noises- an irate auto driver blowing a horn; the sound of overbearing pigeons that were such a nuisance on the banister; even the cry of a kulfi seller in summer- entering from the balcony of the third floor flat we occupied in those days, in a lane in a Bombay suburb, before we left the city for good. These sounds, in turn, would invade, hesitantly, the ebb and flow of silence inside the artificially heated room, in a borough of West London, in which I used to live as an undergraduate. There, in the trapped dust, silence and heat, the theka of the tabla, qualified by the imminent but intermittent presence of the Bombay suburb, would come to life again. A few years later, the tabla and, in the background, the pigeons and the itinerant kulfi seller, would inhabit a small graduate room in Oxford.

The tape recorder, though, remains an extension of the oral transmission of music, rather than a replacement of it. And the oral transmission of North Indian classical music remains, almost uniquely, a testament to the fact that the human brain can absorb, remember and reproduce structures of great complexity and sophistication without the help of the hieroglyph or written mark or a system of notation. I remember my surprise on discovering that Hazarilalji-who had mastered Kathak dance, tala and North Indian classical music, and who used to narrate to me, occasionally, compositions meant for dance that were grand and intricate in their verbal prosody, architecture and rhythmic complexity- was near illiterate and had barely learnt to write his name in large and clumsy letters.

Of course, attempts have been made, throughout the 20th century, to formally codify and even notate this music, and institutions set up and degrees created, specifically to educate students in this "scientific" and codified manner. Paradoxically, however, this style of teaching has produced no noteworthy student or performer; the most creative musicians still emerge from the guru-shishya relationship, their understanding of music developed by oral communication.

The fact that North Indian classical music emanates from, and has evolved through, oral culture, means that this music has a significantly different aesthetic, and that this aesthetic has a different politics, from that of Western classical music. A piece of music in the Western tradition, at least in its most characteristic and popular conception, originates in its composer, and the connection between the two, between composer and the piece of music, is relatively unambiguous precisely because the composer writes down, in notation, his composition, as a poet might write down and publish his poem. However far the printed sheet of notated music might travel thus from the composer, it still remains his property; and the notion of property remains at the heart of the Western conception of "genius", which derives from the Latin gignere or 'to beget'.

The genius in Western classical music is, then, the originator, begetter and owner of his work-the printed, notated sheet testifying to his authority over his product and his power, not only of expression or imagination, but of origination. The conductor is a custodian and guardian of this property. Is it an TF-MS-PP-01-0109 15 © www.TestFunda.com accident that Mandelstam, in his notebooks, compares- celebratorily- the conductor's baton to a policeman's, saying all the music of the orchestra lies mute within it, waiting for its first movement to release it into the auditorium?

The raga-transmitted through oral means is, in a sense, no one's property; it is not easy to pin down its source, or to know exactly where its provenance or origin lies. Unlike the Western classical tradition, where the composer begets his piece, notates it and stamps it with his ownership and remains, in effect, larger than, or the father of, his work, in the North Indian classical tradition, the raga-unconfined to a single incarnation, composer or performer-remains necessarily greater than the artiste who invokes it.

This leads to a very different politics of interpretation and valuation, to an aesthetic that privileges the evanescent moment of performance and invocation over the controlling authority of genius and the permanent record. It is a tradition, thus, that would appear to value the performer, as medium, more highly than the composer who presumes to originate what, effectively, cannot be originated in a single person- because the raga is the inheritance of a culture.

According to the author, the inadequacy of teaching North Indian classical music through a codified, notation based system is best illustrated by

A. a loss of the structural beauty of the ragas.
B. a fusion of two opposing approaches creating mundane music.
C. the conversion of free-flowing ragas into stilted set pieces.
D. its failure to produce any noteworthy student or performer.

## 5.16.36 Passage Reading: CAT 2000 | Question: 4 top

**The passage given below is followed by a question. Choose the best answer.**

The current debate on intellectual property rights (IPRs) raises a number of important issues concerning the strategy and policies for building a more dynamic national agricultural research system, the relative roles of public and private sectors, and the role of agribusiness multinational corporations (MNCs). This debate has been stimulated by the international agreement on Trade Related Intellectual Property Rights (TRIPs), negotiated as part of the Uruguay Round. TRIPs, for the first time, seeks to bring innovations in agricultural technology under a new worldwide IPR regime. The agribusiness MNCs (along with pharmaceutical companies) played a leading part in lobbying for such a regime during the Uruguay Round negotiations. The argument was that incentives are necessary to stimulate innovations, and that this calls for a system of patents which gives innovators the sole right to use (or sell/lease the right to use) their innovations for a specified period and protects them against unauthorised copying or use. With strong support of their national governments, they were influential in shaping the agreement on TRIPs, which eventually emerged from the Uruguay Round.

The current debate on TRIPs in India- as indeed elsewhere- echoes wider concerns about 'privatisation' of research and allowing a free field for MNCs in the sphere of biotechnology and agriculture. The agribusiness corporations, and those with unbounded faith in the power of science to overcome all likely problems, point to the vast potential that new technology holds for solving the problems of hunger, malnutrition and poverty in the world. The exploitation of this potential should be encouraged and this is best done by the private sector for which patents are essential. Some, who do not necessarily accept this optimism, argue that fears of MNC domination are exaggerated and that farmers will accept their products only if they decisively outperform the available alternatives. Those who argue against agreeing to introduce an IPR regime in agriculture and encouraging private sector research are apprehensive that this will work to the disadvantage of farmers by making them more and more dependent on monopolistic MNCs. A different, though related apprehension is that extensive use of hybrids and genetically engineered new varieties might increase the vulnerability of agriculture to outbreaks of pests and diseases. The larger, longer-term consequences of reduced biodiversity that may follow from the use of specially bred varieties are also another cause for concern. Moreover, corporations, driven by the profit motive, will necessarily tend to underplay, if not ignore, potential adverse consequences, especially those which are unknown and which may manifest themselves only over a relatively long period. On the other hand, high pressure advertising and aggressive sales campaigns by private companies can seduce farmers into accepting varieties without being aware of potential adverse effects and the possibility of disastrous consequences for their livelihood if these varieties happen to fail. There is no provision under the laws, as they now exist, for compensating users against such eventualities.

Excessive preoccupation with seeds and seed material has obscured other important issues involved in reviewing the research policy. We need to remind ourselves that improved varieties by themselves are not sufficient for sustained growth of yields. In our own experience, some of the early high yielding varieties (HYVs) of rice and wheat were found susceptible to widespread pest attacks; and some had problems of grain quality. Further research was necessary to solve these problems. This largely successful research was almost entirely done in public research institutions. Of course, it could in principle have been done by private companies, but whether they choose to do so depends crucially on the extent of the loss in market for their original introductions on account of the above factors and whether the companies are financially strong enough to absorb the 'losses', invest in research to correct the deficiencies and recover the lost market. Public research, which is not driven by profit, is better placed to take corrective action. Research for improving common pool resource management, maintaining ecological health

and ensuring sustainability is both critical and also demanding in terms of technological challenge and resource requirements. As such research is crucial to the impact of new varieties, chemicals and equipment in the farmer's field, private companies should be interested in such research. But their primary interest is in the sale of seed material, chemicals, equipment and other inputs produced by them. Knowledge and techniques for resource management are not 'marketable' in the same way as those inputs. Their application to land, water and forests has a long gestation and their efficacy depends on resolving difficult problems such as designing institutions for proper and equitable management of common pool resources. Public or quasi-public research institutions informed by broader, long-term concerns can only do such work.

The public sector must therefore continue to play a major role in the national research system. It is both wrong and misleading to pose the problem in terms of public sector versus private sector or of privatisation of research. We need to address problems likely to arise on account of the publicprivatesector complementarily, and ensure that the public research system performs efficiently. Complementarily between various elements of research raises several issues in implementing an IPR regime. Private companies do not produce new varieties and inputs entirely as a result of their own research. Almost all technological improvement is based on knowledge and experience accumulated from the past, and the results of basic and applied research in public and quasi-public institutions (universities, research organisations). Moreover, as is increasingly recognised, accumulated stock of knowledge does not reside only in the scientific community and its academic publications, but is also widely diffused in traditions and folk knowledge of local communities all over.

The deciphering of the structure and functioning of DNA forms the basis of much of modern biotechnology. But this fundamental breakthrough is a 'public good' freely accessible in the public domain and usable free of any charge. Varieties/techniques developed using that knowledge can however be, and are, patented for private profit. Similarly, private corporations draw extensively, and without any charge, on germ plasm available in varieties of plants species (neem and turmeric are by now famous examples). Publicly funded gene banks as well as new varieties bred by public sector research stations can also be used freely by private enterprises for developing their own varieties and seek patent protection for them. Should private breeders be allowed free use of basic scientific discoveries? Should the repositories of traditional knowledge and germ plasm be collected which are maintained and improved by publicly funded institutions? Or should users be made to pay for such use? If they are to pay, what should be the basis of compensation? Should the compensation be for individuals or for communities/institutions to which they belong? Should individuals/ institutions be given the right of patenting their innovations? These are some of the important issues that deserve more attention than they now get and need serious detailed study to evolve reasonably satisfactory, fair and workable solutions. Finally, the tendency to equate the public sector with the government is wrong. The public space is much wider than government departments and includes co-operatives, universities, public trust and a variety of non-governmental organizations (NGOs). Giving greater autonomy to research organizations from government control and giving non-government public institutions the space and resources to play a larger, more effective role in research, is therefore an issue of direct relevance in restructuring the public research system.

Which one of the following may provide incentives to address the problem of potential adverse consequences of biotechnology?

A. Include IPR issues in the TRIPs agreement.
B. Nationalise MNCs engaged in private research in biotechnology.
C. Encourage domestic firms to patent their innovations.
D. Make provisions in the law for user compensation against failure of newly developed varieties.

cat2000 verbal-ability passage-reading

## 5.16.37 Passage Reading: CAT 2000 | Question: 40 top

**The passage given below is followed by a question. Choose the best answer.**

The teaching and transmission of North Indian classical music is, and long has been, achieved by largely oral means. The raga and its structure, the often breathtaking intricacies of tala or rhythm, and the incarnation of raga and tala as bandish or composition, are passed thus, between guru and shishya by word of mouth and direct demonstration, with no printed sheet of notated music, as it were, acting as a go-between. Saussure's conception of language as a communication between addresser and addressee is given, in this model, a further instance, and a new exotic complexity and glamour.

These days, especially with the middle class having entered the domain of classical music and playing not a small part in ensuring the continuation of this ancient tradition, the tape recorder serves as a handy technological slave and preserves, from oblivion, the vanishing, elusive moment of oral transmission. Hoary gurus, too, have seen the advantage of this device, and increasingly use it as an aid to instructing their pupils; in place of the shawls and other traditional objects that used to pass from shishya to guru in the past, as a token of the regard of the former for the latter, it is not unusual, today, to see cassettes changing hands.

Part of my education in North Indian classical music was conducted via this rather ugly but beneficial rectangle of plastic, which I carried with me to England when I was an undergraduate. One cassette had stored in it various talas played upon the tabla, at various tempos, by my music teacher's brother-inlaw, Hazarilalji, who was a teacher of Kathak dance, as well as a singer and a tabla player. This was a work of great patience and prescience, a one-and-a-half hour performance without any immediate point or purpose, but intended for some delayed future moment when I'd practise the talas solitarily.

This repeated playing out of the rhythmic cycles on the tabla was inflected by the noises- an irate auto driver blowing a horn;

the sound of overbearing pigeons that were such a nuisance on the banister; even the cry of a kulfi seller in summer- entering from the balcony of the third floor flat we occupied in those days, in a lane in a Bombay suburb, before we left the city for good. These sounds, in turn, would invade, hesitantly, the ebb and flow of silence inside the artificially heated room, in a borough of West London, in which I used to live as an undergraduate. There, in the trapped dust, silence and heat, the theka of the tabla, qualified by the imminent but intermittent presence of the Bombay suburb, would come to life again. A few years later, the tabla and, in the background, the pigeons and the itinerant kulfi seller, would inhabit a small graduate room in Oxford.

The tape recorder, though, remains an extension of the oral transmission of music, rather than a replacement of it. And the oral transmission of North Indian classical music remains, almost uniquely, a testament to the fact that the human brain can absorb, remember and reproduce structures of great complexity and sophistication without the help of the hieroglyph or written mark or a system of notation. I remember my surprise on discovering that Hazarilalji-who had mastered Kathak dance, tala and North Indian classical music, and who used to narrate to me, occasionally, compositions meant for dance that were grand and intricate in their verbal prosody, architecture and rhythmic complexity- was near illiterate and had barely learnt to write his name in large and clumsy letters.

Of course, attempts have been made, throughout the 20th century, to formally codify and even notate this music, and institutions set up and degrees created, specifically to educate students in this "scientific" and codified manner. Paradoxically, however, this style of teaching has produced no noteworthy student or performer; the most creative musicians still emerge from the guru-shishya relationship, their understanding of music developed by oral communication.

The fact that North Indian classical music emanates from, and has evolved through, oral culture, means that this music has a significantly different aesthetic, and that this aesthetic has a different politics, from that of Western classical music. A piece of music in the Western tradition, at least in its most characteristic and popular conception, originates in its composer, and the connection between the two, between composer and the piece of music, is relatively unambiguous precisely because the composer writes down, in notation, his composition, as a poet might write down and publish his poem. However far the printed sheet of notated music might travel thus from the composer, it still remains his property; and the notion of property remains at the heart of the Western conception of "genius", which derives from the Latin gignere or 'to beget'.

The genius in Western classical music is, then, the originator, begetter and owner of his work-the printed, notated sheet testifying to his authority over his product and his power, not only of expression or imagination, but of origination. The conductor is a custodian and guardian of this property. Is it an TF-MS-PP-01-0109 15 © www.TestFunda.com accident that Mandelstam, in his notebooks, compares- celebratorily- the conductor's baton to a policeman's, saying all the music of the orchestra lies mute within it, waiting for its first movement to release it into the auditorium?

The raga-transmitted through oral means is, in a sense, no one's property; it is not easy to pin down its source, or to know exactly where its provenance or origin lies. Unlike the Western classical tradition, where the composer begets his piece, notates it and stamps it with his ownership and remains, in effect, larger than, or the father of, his work, in the North Indian classical tradition, the raga-unconfined to a single incarnation, composer or performer-remains necessarily greater than the artiste who invokes it.

This leads to a very different politics of interpretation and valuation, to an aesthetic that privileges the evanescent moment of performance and invocation over the controlling authority of genius and the permanent record. It is a tradition, thus, that would appear to value the performer, as medium, more highly than the composer who presumes to originate what, effectively, cannot be originated in a single person- because the raga is the inheritance of a culture.

Which of the following statements best conveys the overall idea of the passage?

A. North Indian and Western classical music are structurally different.
B. Western music is the intellectual property of the genius while the North Indian raga is the inheritance of a culture.
C. Creation as well as performance is important in the North Indian classical tradition.
D. North Indian classical music is orally transmitted while Western classical music depends on written down notations

## 5.16.39 Passage Reading: CAT 2000 | Question: 6 top

**The passage given below is followed by a question. Choose the best answer.**

The current debate on intellectual property rights (IPRs) raises a number of important issues concerning the strategy and policies for building a more dynamic national agricultural research system, the relative roles of public and private sectors, and the role of agribusiness multinational corporations (MNCs). This debate has been stimulated by the international agreement on Trade Related Intellectual Property Rights (TRIPs), negotiated as part of the Uruguay Round. TRIPs, for the first time, seeks to bring innovations in agricultural technology under a new worldwide IPR regime. The agribusiness MNCs (along with pharmaceutical companies) played a leading part in lobbying for such a regime during the Uruguay Round negotiations. The argument was that incentives are necessary to stimulate innovations, and that this calls for a system of patents which gives innovators the sole right to use (or sell/lease the right to use) their innovations for a specified period and protects them against unauthorized copying or use. With strong support of their national governments, they were influential in shaping the agreement on TRIPs, which eventually emerged from the Uruguay Round.

The current debate on TRIPs in India- as indeed elsewhere- echoes wider concerns about 'privatisation' of research and allowing a free field for MNCs in the sphere of biotechnology and agriculture. The agribusiness corporations, and those with unbounded faith in the power of science to overcome all likely problems, point to the vast potential that new technology holds for solving the problems of hunger, malnutrition and poverty in the world. The exploitation of this potential should be encouraged and this is best done by the private sector for which patents are essential. Some, who do not necessarily accept this optimism, argue that fears of MNC domination are exaggerated and that farmers will accept their products only if they decisively outperform the available alternatives. Those who argue against agreeing to introduce an IPR regime in agriculture and encouraging private sector research are apprehensive that this will work to the disadvantage of farmers by making them more and more dependent on monopolistic MNCs. A different, though related apprehension is that extensive use of hybrids and genetically engineered new varieties might increase the vulnerability of agriculture to outbreaks of pests and diseases. The larger, longer-term consequences of reduced biodiversity that may follow from the use of specially bred varieties are also another cause for concern. Moreover, corporations, driven by the profit motive, will necessarily tend to underplay, if not ignore, potential adverse consequences, especially those which are unknown and which may manifest themselves only over a relatively long period. On the other hand, high pressure advertising and aggressive sales campaigns by private companies can seduce farmers into accepting varieties without being aware of potential adverse effects and the possibility of disastrous consequences for their livelihood if these varieties happen to fail. There is no provision under the laws, as they now exist, for compensating users against such eventualities.

Excessive preoccupation with seeds and seed material has obscured other important issues involved in reviewing the research policy. We need to remind ourselves that improved varieties by themselves are not sufficient for sustained growth of yields. In our own experience, some of the early high yielding varieties (HYVs) of rice and wheat were found susceptible to widespread pest attacks; and some had problems of grain quality. Further research was necessary to solve these problems. This largely successful research was almost entirely done in public research institutions. Of course, it could in principle have been done by private companies, but whether they choose to do so depends crucially on the extent of the loss in market for their original introductions on account of the above factors and whether the companies are financially strong enough to absorb the 'losses', invest in research to correct the deficiencies and recover the lost market. Public research, which is not driven by profit, is better placed to take corrective action. Research for improving common pool resource management, maintaining ecological health and ensuring sustainability is both critical and also demanding in terms of technological challenge and resource requirements. As such research is crucial to the impact of new varieties, chemicals and equipment in the farmer's field, private companies should be interested in such research. But their primary interest is in the sale of seed material, chemicals, equipment and other inputs produced by them. Knowledge and techniques for resource management are not 'marketable' in the same way as those inputs. Their application to land, water and forests has a long gestation and their efficacy depends on resolving difficult problems such as designing institutions for proper and equitable management of common pool resources. Public or quasi-public research institutions informed by broader, long-term concerns can only do such work.

The public sector must therefore continue to play a major role in the national research system. It is both wrong and misleading to pose the problem in terms of public sector versus private sector or of privatisation of research. We need to address problems likely to arise on account of the publicprivatesector complementarily, and ensure that the public research system performs efficiently. Complementarily between various elements of research raises several issues in implementing an IPR regime. Private companies do not produce new varieties and inputs entirely as a result of their own research. Almost all technological improvement is based on knowledge and experience accumulated from the past, and the results of basic and applied research in public and quasi-public institutions (universities, research organisations). Moreover, as is increasingly recognised, accumulated stock of knowledge does not reside only in the scientific community and its academic publications, but is also widely diffused in traditions and folk knowledge of local communities all over.

The deciphering of the structure and functioning of DNA forms the basis of much of modern biotechnology. But this fundamental breakthrough is a 'public good' freely accessible in the public domain and usable free of any charge. Varieties/techniques developed using that knowledge can however be, and are, patented for private profit. Similarly, private corporations draw extensively, and without any charge, on germ plasm available in varieties of plants species (neem and turmeric are by now famous examples). Publicly funded gene banks as well as new varieties bred by public sector research stations can also be used freely by private enterprises for developing their own varieties and seek patent protection for them. Should private breeders be allowed free use of basic scientific discoveries? Should the repositories of traditional knowledge and germ plasm be collected which are maintained and improved by publicly funded institutions? Or should users be made to pay for such use? If they are to pay, what should be the basis of compensation? Should the compensation be for individuals or for communities/institutions to which they belong? Should individuals/ institutions be given the right of patenting their innovations? These are some of the important issues that deserve more attention than they now get and need serious detailed study to evolve reasonably satisfactory, fair and workable solutions. The public space is much wider than government departments and includes co-operatives, universities, public trust and a variety of non-governmental organizations (NGOs). Giving greater autonomy to research organizations from government control and giving non-government public institutions the space and resources to play a larger, more effective role in research, is therefore an issue of direct relevance in restructuring the public research system.

The TRIPs agreement emerged from the Uruguay Round to

A. address the problem of adverse consequences of genetically engineered new varieties of grain.
B. fulfil the WTO requirement to have an agreement on trade related property rights.
C. provide incentives to innovators by way of protecting their intellectual property.
D. give credibility to the innovations made by MNCs in the field of pharmaceuticals and agriculture.

cat2000 verbal-ability passage-reading

## 5.16.40 Passage Reading: CAT 2000 | Question: 7 top

**The passage given below is followed by a question. Choose the best answer.**

The current debate on intellectual property rights (IPRs) raises a number of important issues concerning the strategy and policies for building a more dynamic national agricultural research system, the relative roles of public and private sectors, and the role of agribusiness multinational corporations (MNCs). This debate has been stimulated by the international agreement on Trade Related Intellectual Property Rights (TRIPs), negotiated as part of the Uruguay Round. TRIPs, for the first time, seeks to bring innovations in agricultural technology under a new worldwide IPR regime. The agribusiness MNCs (along with pharmaceutical companies) played a leading part in lobbying for such a regime during the Uruguay Round negotiations. The argument was that incentives are necessary to stimulate innovations, and that this calls for a system of patents which gives innovators the sole right to use (or sell/lease the right to use) their innovations for a specified period and protects them against unauthorized copying or use. With strong support of their national governments, they were influential in shaping the agreement on TRIPs, which eventually emerged from the Uruguay Round.

The current debate on TRIPs in India- as indeed elsewhere- echoes wider concerns about 'privatisation' of research and allowing a free field for MNCs in the sphere of biotechnology and agriculture. The agribusiness corporations, and those with unbounded faith in the power of science to overcome all likely problems, point to the vast potential that new technology holds for solving the problems of hunger, malnutrition and poverty in the world. The exploitation of this potential should be encouraged and this is best done by the private sector for which patents are essential. Some, who do not necessarily accept this optimism, argue that fears of MNC domination are exaggerated and that farmers will accept their products only if they decisively outperform the available alternatives. Those who argue against agreeing to introduce an IPR regime in agriculture and encouraging private sector research are apprehensive that this will work to the disadvantage of farmers by making them more and more dependent on monopolistic MNCs. A different, though related apprehension is that extensive use of hybrids and genetically engineered new varieties might increase the vulnerability of agriculture to outbreaks of pests and diseases. The larger, longer-term consequences of reduced biodiversity that may follow from the use of specially bred varieties are also another cause for concern. Moreover, corporations, driven by the profit motive, will necessarily tend to underplay, if not ignore, potential adverse consequences, especially those which are unknown and which may manifest themselves only over a relatively long period. On the other hand, high pressure advertising and aggressive sales campaigns by private companies can seduce farmers into accepting varieties without being aware of potential adverse effects and the possibility of disastrous consequences for their livelihood if these varieties happen to fail. There is no provision under the laws, as they now exist, for compensating users against such eventualities.

Excessive preoccupation with seeds and seed material has obscured other important issues involved in reviewing the research policy. We need to remind ourselves that improved varieties by themselves are not sufficient for sustained growth of yields. In our own experience, some of the early high yielding varieties (HYVs) of rice and wheat were found susceptible to widespread pest attacks; and some had problems of grain quality. Further research was necessary to solve these problems. This largely successful research was almost entirely done in public research institutions. Of course, it could in principle have been done by private companies, but whether they choose to do so depends crucially on the extent of the loss in market for their original introductions on account of the above factors and whether the companies are financially strong enough to absorb the 'losses', invest in research to correct the deficiencies and recover the lost market. Public research, which is not driven by profit, is better placed to take corrective action. Research for improving common pool resource management, maintaining ecological health and ensuring sustainability is both critical and also demanding in terms of technological challenge and resource requirements.

As such research is crucial to the impact of new varieties, chemicals and equipment in the farmer's field, private companies should be interested in such research. But their primary interest is in the sale of seed material, chemicals, equipment and other inputs produced by them. Knowledge and techniques for resource management are not 'marketable' in the same way as those inputs. Their application to land, water and forests has a long gestation and their efficacy depends on resolving difficult problems such as designing institutions for proper and equitable management of common pool resources. Public or quasi-public research institutions informed by broader, long-term concerns can only do such work.

The public sector must therefore continue to play a major role in the national research system. It is both wrong and misleading to pose the problem in terms of public sector versus private sector or of privatisation of research. We need to address problems likely to arise on account of the publicprivatesector complementarily, and ensure that the public research system performs efficiently. Complementarily between various elements of research raises several issues in implementing an IPR regime. Private companies do not produce new varieties and inputs entirely as a result of their own research. Almost all technological improvement is based on knowledge and experience accumulated from the past, and the results of basic and applied research in public and quasi-public institutions (universities, research organisations). Moreover, as is increasingly recognised, accumulated stock of knowledge does not reside only in the scientific community and its academic publications, but is also widely diffused in traditions and folk knowledge of local communities all over.

The deciphering of the structure and functioning of DNA forms the basis of much of modern biotechnology. But this fundamental breakthrough is a 'public good' freely accessible in the public domain and usable free of any charge. Varieties/techniques developed using that knowledge can however be, and are, patented for private profit. Similarly, private corporations draw extensively, and without any charge, on germ plasm available in varieties of plants species (neem and turmeric are by now famous examples). Publicly funded gene banks as well as new varieties bred by public sector research stations can also be used freely by private enterprises for developing their own varieties and seek patent protection for them. Should private breeders be allowed free use of basic scientific discoveries? Should the repositories of traditional knowledge and germ plasm be collected which are maintained and improved by publicly funded institutions? Or should users be made to pay for such use? If they are to pay, what should be the basis of compensation? Should the compensation be for individuals or for communities/institutions to which they belong? Should individuals/ institutions be given the right of patenting their innovations? These are some of the important issues that deserve more attention than they now get and need serious detailed study to evolve reasonably satisfactory, fair and workable solutions. Finally, the tendency to equate the public sector with the government is wrong. The public space is much wider than government departments and includes co-operatives, universities, public trust and a variety of non-governmental organizations (NGOs). Giving greater autonomy to research organizations from government control and giving non-government public institutions the space and resources to play a larger, more effective role in research, is therefore an issue of direct relevance in restructuring the public research system.

Public or quasi-public research institutions are more likely than private companies to address the negative consequences of new technologies, because of which of the following reasons?

A. Public research is not driven by profit motive.
B. Private companies may not be able to absorb losses arising out of the negative effects of the new technologies.
C. Unlike new technology products, knowledge and techniques for resource management are not amenable to simple market transactions.
D. All of the above.

## 5.16.41 Passage Reading: CAT 2000 | Question: 8 top

**The passage given below is followed by a question. Choose the best answer.**

The current debate on intellectual property rights (IPRs) raises a number of important issues concerning the strategy and policies for building a more dynamic national agricultural research system, the relative roles of public and private sectors, and the role of agribusiness multinational corporations (MNCs). This debate has been stimulated by the international agreement on Trade Related Intellectual Property Rights (TRIPs), negotiated as part of the Uruguay Round. TRIPs, for the first time, seeks to bring innovations in agricultural technology under a new worldwide IPR regime. The agribusiness MNCs (along with pharmaceutical companies) played a leading part in lobbying for such a regime during the Uruguay Round negotiations. The argument was that incentives are necessary to stimulate innovations, and that this calls for a system of patents which gives innovators the sole right to use (or sell/lease the right to use) their innovations for a specified period and protects them against unauthorized copying or use. With strong support of their national governments, they were influential in shaping the agreement on TRIPs, which eventually emerged from the Uruguay Round.

The current debate on TRIPs in India- as indeed elsewhere- echoes wider concerns about 'privatisation' of research and allowing a free field for MNCs in the sphere of biotechnology and agriculture. The agribusiness corporations, and those with unbounded faith in the power of science to overcome all likely problems, point to the vast potential that new technology holds for solving the problems of hunger, malnutrition and poverty in the world. The exploitation of this potential should be encouraged and this is best done by the private sector for which patents are essential. Some, who do not necessarily accept this optimism, argue that fears of MNC domination are exaggerated and that farmers will accept their products only if they decisively outperform the available alternatives. Those who argue against agreeing to introduce an IPR regime in agriculture and encouraging private sector research are apprehensive that this will work to the disadvantage of farmers by making them more and more dependent on monopolistic MNCs. A different, though related apprehension is that extensive use of hybrids and

genetically engineered new varieties might increase the vulnerability of agriculture to outbreaks of pests and diseases. The larger, longer-term consequences of reduced biodiversity that may follow from the use of specially bred varieties are also another cause for concern. Moreover, corporations, driven by the profit motive, will necessarily tend to underplay, if not ignore, potential adverse consequences, especially those which are unknown and which may manifest themselves only over a relatively long period. On the other hand, high pressure advertising and aggressive sales campaigns by private companies can seduce farmers into accepting varieties without being aware of potential adverse effects and the possibility of disastrous consequences for their livelihood if these varieties happen to fail. There is no provision under the laws, as they now exist, for compensating users against such eventualities.

Excessive preoccupation with seeds and seed material has obscured other important issues involved in reviewing the research policy. We need to remind ourselves that improved varieties by themselves are not sufficient for sustained growth of yields. In our own experience, some of the early high yielding varieties (HYVs) of rice and wheat were found susceptible to widespread pest attacks; and some had problems of grain quality. Further research was necessary to solve these problems. This largely successful research was almost entirely done in public research institutions. Of course, it could in principle have been done by private companies, but whether they choose to do so depends crucially on the extent of the loss in market for their original introductions on account of the above factors and whether the companies are financially strong enough to absorb the 'losses', invest in research to correct the deficiencies and recover the lost market. Public research, which is not driven by profit, is better placed to take corrective action. Research for improving common pool resource management, maintaining ecological health and ensuring sustainability is both critical and also demanding in terms of technological challenge and resource requirements. As such research is crucial to the impact of new varieties, chemicals and equipment in the farmer's field, private companies should be interested in such research. But their primary interest is in the sale of seed material, chemicals, equipment and other inputs produced by them. Knowledge and techniques for resource management are not 'marketable' in the same way as those inputs. Their application to land, water and forests has a long gestation and their efficacy depends on resolving difficult problems such as designing institutions for proper and equitable management of common pool resources. Public or quasi-public research institutions informed by broader, long-term concerns can only do such work.

The public sector must therefore continue to play a major role in the national research system. It is both wrong and misleading to pose the problem in terms of public sector versus private sector or of privatisation of research. We need to address problems likely to arise on account of the publicprivatesector complementarily, and ensure that the public research system performs efficiently. Complementarily between various elements of research raises several issues in implementing an IPR regime. Private companies do not produce new varieties and inputs entirely as a result of their own research. Almost all technological improvement is based on knowledge and experience accumulated from the past, and the results of basic and applied research in public and quasi-public institutions (universities, research organisations). Moreover, as is increasingly recognised, accumulated stock of knowledge does not reside only in the scientific community and its academic publications, but is also widely diffused in traditions and folk knowledge of local communities all over.

The deciphering of the structure and functioning of DNA forms the basis of much of modern biotechnology. But this fundamental breakthrough is a 'public good' freely accessible in the public domain and usable free of any charge. Varieties/techniques developed using that knowledge can however be, and are, patented for private profit. Similarly, private corporations draw extensively, and without any charge, on germ plasm available in varieties of plants species (neem and turmeric are by now famous examples). Publicly funded gene banks as well as new varieties bred by public sector research stations can also be used freely by private enterprises for developing their own varieties and seek patent protection for them. Should private breeders be allowed free use of basic scientific discoveries? Should the repositories of traditional knowledge and germ plasm be collected which are maintained and improved by publicly funded institutions? Or should users be made to pay for such use? If they are to pay, what should be the basis of compensation? Should the compensation be for individuals or for communities/institutions to which they belong? Should individuals/ institutions be given the right of patenting their innovations? These are some of the important issues that deserve more attention than they now get and need serious detailed study to evolve reasonably satisfactory, fair and workable solutions. Finally, the tendency to equate the public sector with the government is wrong. The public space is much wider than government departments and includes co-operatives, universities, public trust and a variety of non-governmental organizations (NGOs). Giving greater autonomy to research organizations from government control and giving non-government public institutions the space and resources to play a larger, more effective role in research, is therefore an issue of direct relevance in restructuring the public research system.

While developing a strategy and policies for building a more dynamic national agricultural research system, which one of the following statements needs to be considered?

A. Public and quasi-public institutions are not interested in making profits.
B. Public and quasi-public institutions have a broader and long-term outlook than private companies.
C. Private companies are incapable of building products based on traditional and folk knowledge.
D. Traditional and folk knowledge cannot be protected by patents.

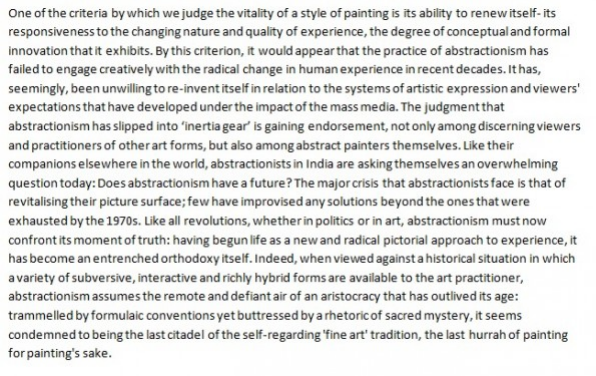
## 5.16.42 Passage Reading: CAT 2000 | Question: 9 top

**The passage given below is followed by a question. Choose the best answer.**



One of the criteria by which we judge the vitality of a style of painting is its ability to renew itself- its responsiveness to the changing nature and quality of experience, the degree of conceptual and formal innovation that it exhibits. By this criterion, it would appear that the practice of abstractionism has failed to engage creatively with the radical change in human experience in recent decades. It has, seemingly, been unwilling to re-invent itself in relation to the systems of artistic expression and viewers' expectations that have developed under the impact of the mass media. The judgment that abstractionism has slipped into 'inertia gear' is gaining endorsement, not only among discerning viewers and practitioners of other art forms, but also among abstract painters themselves. Like their companions elsewhere in the world, abstractionists in India are asking themselves an overwhelming question today: Does abstractionism have a future? The major crisis that abstractionists face is that of revitalising their picture surface; few have improvised any solutions beyond the ones that were exhausted by the 1970s. Like all revolutions, whether in politics or in art, abstractionism must now confront its moment of truth: having begun life as a new and radical pictorial approach to experience, it has become an entrenched orthodoxy itself. Indeed, when viewed against a historical situation in which a variety of subversive, interactive and richly hybrid forms are available to the art practitioner, abstractionism assumes the remote and defiant air of an aristocracy that has outlived its age: trammelled by formulaic conventions yet buttressed by a rhetoric of sacred mystery, it seems condemned to being the last citadel of the self-regarding 'fine art' tradition, the last hurrah of painting for painting's sake.

One of the criteria by which we judge the vitality of a style of painting is its ability to renew itself-its responsiveness to the changing nature and quality of experience, the degree of conceptual and formal innovation that it exhibits. By this criterion, it would appear that the practice of abstractionism has failed to engage creatively with the radical change in human experience in recent decades. it has, seemingly, been unwilling to re-invent itself in relation to the systems of artistic expression and viewers' expectations has slipped into 'inertia gear' is gaining endorsement, not only among discerning viewers and practitioners of other art forms, but also among abstract painters themselves an overwhelming question today: Does abstractionism have a future? The major crisis that abstractionists face is that of revitalising their picture surface; few have improvised any solutions beyond the ones that were exhausted by the 1970s. Like all revolutions, whether in politics or in art, abstractionism must now confront its moment of truth: having begun life as a new and radical pictorial approach to experience, it has become an entrenched orthodoxy itself. Indeed, when viewed against a historical situation in which a variety of subversive, interactive and richly hybrid forms are available to the art practitioner, abstractionism assumes the remote and defiant air of an aristocracy that has outlived its age: trammelled by formulaic conventions yet buttressed by a rhetoric of sacred mystery, it seems condemned to being the last citadel of the self-regarding 'fine art' tradition, the last hurrah of painting for painting's sake.

The situation is further complicated in India by the circumstances in which an indigenous abstractionism came into prominence here during the 1960s. From the beginning it was propelled by the dialectic between two motives, one revolutionary and the other conservative-it was inaugurated as an act of emancipation from the dogmas of the nascent Indian nation state, when art was officially viewed as an indulgence at worst, and at best, as an instrument for the celebration of the republic's hopes and aspirations. Having rejected these dogmas, the pioneering abstractionists also went on to reject the various figurative styles associated with the Shantiniketan circle and others. In such a situation, abstractionism was a revolutionary move. It led art towards the exploration of the subconscious mind, the spiritual quest and the possible expansion of consciousness. Indian painting entered into a phase of self-inquiry, a meditative inner space where cosmic symbols and non-representational images ruled. Often, the transition from figurative idioms to abstractionist ones took place within the same artist.

At the same time, Indian abstractionists have rarely committed themselves wholeheartedly to a nonrepresentational idiom. They have been preoccupied with the fundamentally metaphysical project of aspiring to the mystical-holy without altogether renouncing the symbolic. This has been sustained by a hereditary reluctance to give up the murti, the inviolable iconic form, which explains why abstractionism is marked by the conservative tendency to operate with images from the sacred repertoire of the past. Abstractionism thus entered India as a double-edged device in a complex cultural transaction. Ideologically, it served as an internationalist legitimisation of the emerging revolutionary local trends. However, on entry, it was conscripted to serve local artistic preoccupations– a survey of indigenous abstractionism will show that its most obvious points of affinity with European and American abstract art were with the more mystically oriented of the major sources of abstractionist philosophy and practice, for instance the KandinskyKlee school. There have been no takers for Malevich's Suprematism, which militantly rejected both the artistic forms of the past and the world of appearances, privileging the new-minted geometric symbol as an autonomous sign of the desire for infinity.

Against this backdrop, we can identify three major abstractionist idioms in Indian art. The first develops from a love of the earth, and assumes the form of a celebration of the self's dissolution in the cosmic panorama; the landscape is no longer a realistic transcription of the scene, but is transformed into a visionary occasion for contemplating the cycles of decay and regeneration. The second idiom phrases its departures from symbolic and archetypal devices as invitations to heightened planes of awareness. Abstractionism begins with the establishment or dissolution of the motif, which can be drawn from diverse sources, including the hieroglyphic tablet, the Sufi meditation dance or the Tantric diagram. The third idiom is based on the lyric play of forms guided by gesture or allied with formal improvisations like the assemblage. Here, sometimes, the line dividing abstract image from patterned design or quasirandom expressive marking may blur. The flux of forms can also be regimented through the poetics of pure colour arrangements, vector-diagrammatic spaces and gestural design.

In this genealogy, some pure lines of descent follow their logic to the inevitable point of extinction, others engage in cross-fertilization, and yet others undergo mutation to maintain their energy. However, this genealogical survey demonstrates the wave at its crests, those points where the metaphysical and the painterly have been fused in images of abiding potency, ideas sensuously ordained rather than fabricated programmatically to a concept. It is equally possible to enumerate the thoughts where the two principles do not come together, thus arriving at a very different account. Uncharitable as it may sound, the history of Indian abstractionism records a series of attempts to avoid the risks of abstraction by resorting to an overt and near-

generic symbolism, which many Indian abstractionists embrace when they find themselves bereft of the imaginative energy to negotiate the union of metaphysics and painterliness.

Such symbolism falls into a dual trap: it succumbs to the pompous vacuity of pure metaphysics when the burden of intention is passed off as justification; or then it is desiccated by the arid formalism of pure painterliness, with delight in the measure of chance or pattern guiding the execution of a painting. The ensuing conflict of purpose stalls the progress of abstractionism in an impasse. The remarkable Indian abstractionists are precisely those who have overcome this and addressed themselves to the basic elements of their art with a decisive sense of independence from prior models. In their recent work, we see the logic of Indian abstractionism pushed almost to the furthest it can be taken. Beyond such artists stands a lost generation of abstractionists whose work invokes a wistful, delicate beauty but stops there.

Abstractionism is not a universal language; it is an art that points up the loss of a shared language of signs in society. And yet, it affirms the possibility of its recovery through the effort of awareness. While its rhetoric has always emphasised a call for new forms of attention, abstractionist practice has tended to fall into a complacent pride in its own incomprehensibility; a complacency fatal in an ethos where vibrant new idioms compete for the viewers' attention. Indian abstractionists ought to really return to basics, to reformulate and replenish their understanding of the nature of the relationship between the painted image and the world around it. But will they abandon their favourite conceptual habits and formal conventions, if this becomes necessary?

Which one of the following is not stated by the author as a reason for abstractionism losing its vitality?

A. Abstractionism has failed to reorient itself in the context of changing human experience.
B. Abstractionism has not considered the developments in artistic expression that have taken place in recent times.
C. Abstractionism has not followed the path taken by all revolutions, whether in politics or art.
D. The impact of mass media on viewers' expectations has not been assessed, and responded to, by abstractionism.

cat2000 verbal-ability passage-reading

## 5.16.43 Passage Reading: CAT 2001 | Question: 100 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

In the modern scientific story, light was created not once but twice. The first time was in the Big Bang, when the universe began its existence as a glowing, expanding, fireball, which cooled off into darkness after a few million years. The second time was hundreds of millions of years later, when the cold material condensed into dense nuggets under the influence of gravity, and ignited to become the first stars.

Sir Martin Rees, Britain's astronomer royal, named the long interval between these two enlightenments the cosmic "Dark Age". The name describes not only the poorly lit conditions, but also the ignorance of astronomers about that period. Nobody knows exactly when the first stars formed, or how they organised themselves into galaxies-or even whether stars were the first luminous objects. They may have been preceded by quasars, which are mysterious, bright spots found at the centres of some galaxies.

Now, two independent groups of astronomers, one led by Robert Becker of the University of California, Davis, and the other by George Djorgovski of Caltech, claim to have peered far enough into space with their telescopes (and therefore backwards enough in time) to observe the closing days of the Dark Age.

The main problem that plagued previous efforts to study the Dark Age was not the lack of suitable telescopes, but rather the lack of suitable things at which to point them. Because these events took place over 13 billion years ago, if astronomers are to have any hope of unravelling them they must study objects that are at least 13 billion light years away. The best prospects are quasars, because they are so bright and compact that they can be seen across vast stretches of space. The energy source that powers a quasar is unknown, although it is suspected to be the intense gravity of a giant black hole. However, at the distances required for the study of Dark Age, even quasars are extremely rare and faint.

Recently some members of Dr. Becker's team announced their discovery of the four most distant quasars known. All the new quasars are terribly faint, a challenge that both teams overcome by peering at them through one of the twin Keck telescopes in Hawaii. These are the world's largest, and can therefore collect the most light. The new work by Dr. Becker's team analysed the light from all four quasars. Three of them appeared to be similar to ordinary, less distant quasars. However, the fourth and most distant, unlike any other quasar ever seen, showed unmistakable signs of being shrouded in a fog of hydrogen gas. This gas is leftover material from the Big Bang that did not condense into stars or quasars. It acts like fog because new-born stars and quasars emit mainly ultraviolet light, and hydrogen gas is opaque to ultraviolet. Seeing this fog had been the goal of would-be Dark Age astronomers since 1965, when James Gunn and Bruce Peterson spelled out the technique for using quasars as backlighting beacons to observe the fog's ultraviolet shadow.

The fog prolonged the period of darkness until the heat from the first stars and quasars had the chance to ionise the hydrogen (breaking it into its constituent parts, protons and electrons). Ionised hydrogen is transparent to ultraviolet radiation, so at that moment the fog lifted and the universe became the well-lit place it is today. For this reason, the end of the Dark Age is called the "Epoch of Re-ionisation". Because the ultraviolet shadow is visible only in the most distant of four quasars, Dr. Becker's team concluded that the fog had dissipated completely by the time the universe was about 900 million years old, and one-

seventh of its current size.

The fog of hydrogen gas seen through the telescopes

A. is transparent to hydrogen radiation from stars and quasars in all states.
B. was lifted after heat from stars and quasars ionised it.
C. is material which eventually became stars and quasars.
D. is broken into constituent elements when stars and quasars are formed.

cat2001 verbal-ability passage-reading

## 5.16.44 Passage Reading: CAT 2001 | Question: 71 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

The union government's present position vis-a-vis the upcoming United Nations conference on racial and related discrimination world-wide seems to be the following: discuss race please, not caste; caste is our very own and not at all as bad as you think. The gross hypocrisy of that position has been lucidly underscored by Kancha llaiah. Explicitly, the world community is to be cheated out of considering the matter on the technicality that caste is not as a concept, tantamount to a racial category. Internally, however, allowing the issue to be put on agenda at the said conference would, we are patriotically admonished, damage the country's image. Somehow, India's virtual beliefs elbow out concrete actualities. Inverted representations, as we know, have often been deployed in human histories as balm for the forsaken– religion being the most persistent of such inversions. Yet, we would humbly submit that if
globalising our markets are thought good for the 'national' pocket, globalising our social inequities might not be so bad for the mass of our people. After all, racism was as uniquely institutionalised in South Africa as caste discrimination has been within our society; why then can't we permit the world community to express itself on the latter with a fraction of the zeal with which, through the years, we pronounced on the former?

As to the technicality about whether or not caste is admissible into an agenda about race (that the conference is also about 'related discriminations' tends to be forgotten), a reputed sociologist has recently argued that where race is a 'biological' category caste is a 'social' one. Having earlier fiercely opposed implementation of the Mandal Commission Report, the said sociologist is at least to be complemented now for admitting, however tangentially, that caste discrimination is a reality, although, in his view, incompatible with racial discrimination. One would like quickly to offer the hypothesis that biology, in important ways that affect the lives of many millions, is in itself perhaps a social construction. But let us look at the matter in another way.

If it is agreed- as per the positions today at which anthropological and allied scientific determinations rest- that the entire race of homo sapiens derived from an originally black African female (called 'Eve') then one is hard put to understand how, on some subsequent ground, ontological distinctions are to be drawn either between races or castes. Let us also underline the distinction between the supposition that we are all god's children and the rather more substantiated argument about our descent from 'Eve', lest both positions are thought to be equally diversionary. It then stands for reason that all subsequent distinctions are, in modern parlance, 'constructed' ones, and, like all ideological constructions, attributable to changing equations between knowledge and power among human communities through contested histories here, there, and elsewhere.

This line of thought receives, thankfully, extremely consequential buttress from the findings of the Human Genome Project. Contrary to earlier (chiefly 19th century colonial) persuasions on the subject of race, as well as, one might add, the somewhat infamous Jensen offerings in the 20th century from America, those findings deny genetic difference between 'races'. If anything, they suggest that environmental factors impinge on gene-function, as a dialectic seems to unfold between nature and culture. It would thus seem that 'biology' as the constitution of pigmentation enters the picture first only as a part of that dialectic. Taken together, the originally mother stipulation and the Genome findings ought indeed to furnish ground for human equality across the board, as well as yield policy initiatives towards equitable material dispensations aimed at building a global order where, in Hegel's stirring formulation, only the rational constitutes the right. Such, sadly, is not the case as everyday fresh arbitrary grounds for discrimination are constructed in the interests of sectional dominance.

When the author writes "globalising our social inequities", the reference is to

A. going beyond an internal deliberation on social inequity.
B. dealing with internal poverty through the economic benefits of globalisation.
C. going beyond an internal delimitation of social inequity.
D. achieving disadvantaged people's empowerment, globally.

cat2001 verbal-ability passage-reading

## 5.16.45 Passage Reading: CAT 2001 | Question: 72 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

The union government's present position vis-a-vis the upcoming United Nations conference on racial and related

discrimination world-wide seems to be the following: discuss race please, not caste; caste is our very own and not at all as bad as you think. The gross hypocrisy of that position has been lucidly underscored by Kancha llaiah. Explicitly, the world community is to be cheated out of considering the matter on the technicality that caste is not as a concept, tantamount to a racial category. Internally, however, allowing the issue to be put on agenda at the said conference would, we are patriotically admonished, damage the country's image. Somehow, India's virtual beliefs elbow out concrete actualities. Inverted representations, as we know, have often been deployed in human histories as balm for the forsaken– religion being the most persistent of such inversions. Yet, we would humbly submit that if
globalising our markets are thought good for the 'national' pocket, globalising our social inequities might not be so bad for the mass of our people. After all, racism was as uniquely institutionalised in South Africa as caste discrimination has been within our society; why then can't we permit the world community to express itself on the latter with a fraction of the zeal with which, through the years, we pronounced on the former?

As to the technicality about whether or not caste is admissible into an agenda about race (that the conference is also about 'related discriminations' tends to be forgotten), a reputed sociologist has recently argued that where race is a 'biological' category caste is a 'social' one. Having earlier fiercely opposed implementation of the Mandal Commission Report, the said sociologist is at least to be complemented now for admitting, however tangentially, that caste discrimination is a reality, although, in his view, incompatible with racial discrimination. One would like quickly to offer the hypothesis that biology, in important ways that affect the lives of many millions, is in itself perhaps a social construction. But let us look at the matter in another way.

If it is agreed- as per the positions today at which anthropological and allied scientific determinations rest- that the entire race of homo sapiens derived from an originally black African female (called 'Eve') then one is hard put to understand how, on some subsequent ground, ontological distinctions are to be drawn either between races or castes. Let us also underline the distinction between the supposition that we are all god's children and the rather more substantiated argument about our descent from 'Eve', lest both positions are thought to be equally diversionary. It then stands for reason that all subsequent distinctions are, in modern parlance, 'constructed' ones, and, like all ideological constructions, attributable to changing equations between knowledge and power among human communities through contested histories here, there, and elsewhere.

This line of thought receives, thankfully, extremely consequential buttress from the findings of the Human Genome Project. Contrary to earlier (chiefly 19th century colonial) persuasions on the subject of race, as well as, one might add, the somewhat infamous Jensen offerings in the 20th century from America, those findings deny genetic difference between 'races'. If anything, they suggest that environmental factors impinge on gene-function, as a dialectic seems to unfold between nature and culture. It would thus seem that 'biology' as the constitution of pigmentation enters the picture first only as a part of that dialectic. Taken together, the originally mother stipulation and the Genome findings ought indeed to furnish ground for human equality across the board, as well as yield policy initiatives towards equitable material dispensations aimed at building a global order where, in Hegel's stirring formulation, only the rational constitutes the right. Such, sadly, is not the case as everyday fresh arbitrary grounds for discrimination are constructed in the interests of sectional dominance.

According to the author, 'inverted representations as balm for the forsaken'

A. is good for the forsaken and often deployed in human histories.
B. is good for the forsaken, but not often deployed historically for the oppressed.
C. occurs often as a means of keeping people oppressed.
D. occurs often to invert the status quo.

cat2001 verbal-ability passage-reading

## 5.16.46 Passage Reading: CAT 2001 | Question: 73 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

The union government's present position vis-a-vis the upcoming United Nations conference on racial and related discrimination world-wide seems to be the following: discuss race please, not caste; caste is our very own and not at all as bad as you think. The gross hypocrisy of that position has been lucidly underscored by Kancha llaiah. Explicitly, the world community is to be cheated out of considering the matter on the technicality that caste is not as a concept, tantamount to a racial category. Internally, however, allowing the issue to be put on agenda at the said conference would, we are patriotically admonished, damage the country's image. Somehow, India's virtual beliefs elbow out concrete actualities. Inverted representations, as we know, have often been deployed in human histories as balm for the forsaken– religion being the most persistent of such inversions. Yet, we would humbly submit that if
globalising our markets are thought good for the 'national' pocket, globalising our social inequities might not be so bad for the mass of our people. After all, racism was as uniquely institutionalised in South Africa as caste discrimination has been within our society; why then can't we permit the world community to express itself on the latter with a fraction of the zeal with which, through the years, we pronounced on the former?

As to the technicality about whether or not caste is admissible into an agenda about race (that the conference is also about 'related discriminations' tends to be forgotten), a reputed sociologist has recently argued that where race is a 'biological' category caste is a 'social' one. Having earlier fiercely opposed implementation of the Mandal Commission Report, the said sociologist is at least to be complemented now for admitting, however tangentially, that caste discrimination is a reality,

although, in his view, incompatible with racial discrimination. One would like quickly to offer the hypothesis that biology, in important ways that affect the lives of many millions, is in itself perhaps a social construction. But let us look at the matter in another way.

If it is agreed- as per the positions today at which anthropological and allied scientific determinations rest- that the entire race of homo sapiens derived from an originally black African female (called 'Eve') then one is hard put to understand how, on some subsequent ground, ontological distinctions are to be drawn either between races or castes. Let us also underline the distinction between the supposition that we are all god's children and the rather more substantiated argument about our descent from 'Eve', lest both positions are thought to be equally diversionary. It then stands for reason that all subsequent distinctions are, in modern parlance, 'constructed' ones, and, like all ideological constructions, attributable to changing equations between knowledge and power among human communities through contested histories here, there, and elsewhere.

This line of thought receives, thankfully, extremely consequential buttress from the findings of the Human Genome Project. Contrary to earlier (chiefly 19th century colonial) persuasions on the subject of race, as well as, one might add, the somewhat infamous Jensen offerings in the 20th century from America, those findings deny genetic difference between 'races'. If anything, they suggest that environmental factors impinge on gene-function, as a dialectic seems to unfold between nature and culture. It would thus seem that 'biology' as the constitution of pigmentation enters the picture first only as a part of that dialectic. Taken together, the originally mother stipulation and the Genome findings ought indeed to furnish ground for human equality across the board, as well as yield policy initiatives towards equitable material dispensations aimed at building a global order where, in Hegel's stirring formulation, only the rational constitutes the right. Such, sadly, is not the case as everyday fresh arbitrary grounds for discrimination are constructed in the interests of sectional dominance.

Based on the passage, which broad areas unambiguously fall under the purview of the UN conference being discussed?

A. Racial prejudice. B. Racial pride. C. Discrimination, racial or otherwise. D. Caste-related discrimination. E. Race-related discrimination.

A. A, B, E C. C, E D. C, B, E C. D

## 5.16.47 Passage Reading: CAT 2001 | Question: 74 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

The union government's present position vis-a-vis the upcoming United Nations conference on racial and related discrimination world-wide seems to be the following: discuss race please, not caste; caste is our very own and not at all as bad as you think. The gross hypocrisy of that position has been lucidly underscored by Kancha llaiah. Explicitly, the world community is to be cheated out of considering the matter on the technicality that caste is not as a concept, tantamount to a racial category. Internally, however, allowing the issue to be put on agenda at the said conference would, we are patriotically admonished, damage the country's image. Somehow, India's virtual beliefs elbow out concrete actualities. Inverted representations, as we know, have often been deployed in human histories as balm for the forsaken– religion being the most persistent of such inversions. Yet, we would humbly submit that if
globalising our markets are thought good for the 'national' pocket, globalising our social inequities might not be so bad for the mass of our people. After all, racism was as uniquely institutionalised in South Africa as caste discrimination has been within our society; why then can't we permit the world community to express itself on the latter with a fraction of the zeal with which, through the years, we pronounced on the former?

As to the technicality about whether or not caste is admissible into an agenda about race (that the conference is also about 'related discriminations' tends to be forgotten), a reputed sociologist has recently argued that where race is a 'biological' category caste is a 'social' one. Having earlier fiercely opposed implementation of the Mandal Commission Report, the said sociologist is at least to be complemented now for admitting, however tangentially, that caste discrimination is a reality, although, in his view, incompatible with racial discrimination. One would like quickly to offer the hypothesis that biology, in important ways that affect the lives of many millions, is in itself perhaps a social construction. But let us look at the matter in another way.

If it is agreed- as per the positions today at which anthropological and allied scientific determinations rest- that the entire race of homo sapiens derived from an originally black African female (called 'Eve') then one is hard put to understand how, on some subsequent ground, ontological distinctions are to be drawn either between races or castes. Let us also underline the distinction between the supposition that we are all god's children and the rather more substantiated argument about our descent from 'Eve', lest both positions are thought to be equally diversionary. It then stands for reason that all subsequent distinctions are, in modern parlance, 'constructed' ones, and, like all ideological constructions, attributable to changing equations between knowledge and power among human communities through contested histories here, there, and elsewhere.

This line of thought receives, thankfully, extremely consequential buttress from the findings of the Human Genome Project. Contrary to earlier (chiefly 19th century colonial) persuasions on the subject of race, as well as, one might add, the somewhat infamous Jensen offerings in the 20th century from America, those findings deny genetic difference between 'races'. If anything, they suggest that environmental factors impinge on gene-function, as a dialectic seems to unfold between nature and culture. It would thus seem that 'biology' as the constitution of pigmentation enters the picture first only as a part of that dialectic. Taken together, the originally mother stipulation and the Genome findings ought indeed to furnish ground for human equality across the board, as well as yield policy initiatives towards equitable material dispensations aimed at building a global

order where, in Hegel's stirring formulation, only the rational constitutes the right. Such, sadly, is not the case as everyday fresh arbitrary grounds for discrimination are constructed in the interests of sectional dominance.

According to the author, the sociologist who argued that race is a 'biological' category and caste is a 'social' one;

A. generally shares the same orientation as the author's on many of the central issues discussed.
B. tangentially admits to the existence of "caste" as a category.
C. admits the incompatibility between the people of different race and caste.
D. admits indirectly that both caste-based prejudice and racial discrimination exist.

## 5.16.48 Passage Reading: CAT 2001 | Question: 75 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

The union government's present position vis-a-vis the upcoming United Nations conference on racial and related discrimination world-wide seems to be the following: discuss race please, not caste; caste is our very own and not at all as bad as you think. The gross hypocrisy of that position has been lucidly underscored by Kancha llaiah. Explicitly, the world community is to be cheated out of considering the matter on the technicality that caste is not as a concept, tantamount to a racial category. Internally, however, allowing the issue to be put on agenda at the said conference would, we are patriotically admonished, damage the country's image. Somehow, India's virtual beliefs elbow out concrete actualities. Inverted representations, as we know, have often been deployed in human histories as balm for the forsaken– religion being the most persistent of such inversions. Yet, we would humbly submit that if
globalising our markets are thought good for the 'national' pocket, globalising our social inequities might not be so bad for the mass of our people. After all, racism was as uniquely institutionalised in South Africa as caste discrimination has been within our society; why then can't we permit the world community to express itself on the latter with a fraction of the zeal with which, through the years, we pronounced on the former?

As to the technicality about whether or not caste is admissible into an agenda about race (that the conference is also about 'related discriminations' tends to be forgotten), a reputed sociologist has recently argued that where race is a 'biological' category caste is a 'social' one. Having earlier fiercely opposed implementation of the Mandal Commission Report, the said sociologist is at least to be complemented now for admitting, however tangentially, that caste discrimination is a reality, although, in his view, incompatible with racial discrimination. One would like quickly to offer the hypothesis that biology, in important ways that affect the lives of many millions, is in itself perhaps a social construction. But let us look at the matter in another way.

If it is agreed- as per the positions today at which anthropological and allied scientific determinations rest- that the entire race of homo sapiens derived from an originally black African female (called 'Eve') then one is hard put to understand how, on some subsequent ground, ontological distinctions are to be drawn either between races or castes. Let us also underline the distinction between the supposition that we are all god's children and the rather more substantiated argument about our descent from 'Eve', lest both positions are thought to be equally diversionary. It then stands for reason that all subsequent distinctions are, in modern parlance, 'constructed' ones, and, like all ideological constructions, attributable to changing equations between knowledge and power among human communities through contested histories here, there, and elsewhere.

This line of thought receives, thankfully, extremely consequential buttress from the findings of the Human Genome Project. Contrary to earlier (chiefly 19th century colonial) persuasions on the subject of race, as well as, one might add, the somewhat infamous Jensen offerings in the 20th century from America, those findings deny genetic difference between 'races'. If anything, they suggest that environmental factors impinge on gene-function, as a dialectic seems to unfold between nature and culture. It would thus seem that 'biology' as the constitution of pigmentation enters the picture first only as a part of that dialectic. Taken together, the originally mother stipulation and the Genome findings ought indeed to furnish ground for human equality across the board, as well as yield policy initiatives towards equitable material dispensations aimed at building a global order where, in Hegel's stirring formulation, only the rational constitutes the right. Such, sadly, is not the case as everyday fresh arbitrary grounds for discrimination are constructed in the interests of sectional dominance.

An important message in the passage, if one accepts a dialectic between nature and culture, is that;

B. race is at least partially a social construct.
C. discrimination is at least partially a social construct.
D. caste is at least partially a social construct.

cat2001 verbal-ability passage-reading

## 5.16.49 Passage Reading: CAT 2001 | Question: 76 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

Studies of the factors governing reading development in young children have achieved a remarkable degree of consensus over the past two decades. This consensus concerns the causal role of phonological skills in young children's reading progress. Children who have poor phonological skills, progress more poorly. In particular, those who have a specific phonological deficit are likely to be classified as dyslexic by the time that they are 9 or 10 years old.

Phonological skills in young children can be measured at a number of different levels. The term phonological awareness is a global one, and refers to a deficit in recognising smaller units of sound within spoken words. Developmental work has shown that this deficit can be at the level of syllables, of onsets and rimes, or of phonemes. For example, a 4-year old child might have difficulty in recognising that a word like valentine has three syllables, suggesting a lack of syllabic awareness. A 5 year old might have difficulty in recognising that the odd word out in the set of words fan, cat, hat, mat is fan. This task requires an awareness of the sub-syllabic units of the onset and the rime. The onset corresponds to any initial consonants is a syllable, and the rime corresponds to the vowel and to any following consonants. Rimes correspond to rhyme in single-syllable words, and so the rime in fan differs from the rime in cat, hat, and mat. In longer words, rime and rhyme may differ. The onsets in val : en : tine are /v/ and /t/, and the rimes correspond to the spelling patterns 'al', 'en', and 'ine'.

A 6-year-old might have difficulty in recognising that plea and pray begin with the same initial sound. This is a phonemic judgement. Although the initial phoneme /p/ is shared between the two words, in plea it is part of onset 'pl', and in pray it is part of the onset 'pr'. Until children can segment the onset (or the rime), such phonemic judgements are difficult for them to make. In fact, a recent survey of different developmental studies has shown that the different levels of phonological awareness appear to emerge sequentially. The awareness of syllables, onsets, and rimes appears to emerge at around the ages of 3 and 4, long before most children go to school. The awareness of phonemes, on the other hand, usually emerges at around the age of 5 or 6, when children have been taught to read for about a year. An awareness of onsets and rimes thus appears to be a precursor of reading, whereas an awareness of phonemes at every serial position in a word only appears to develop as reading is taught. The onsetrime and phonemic levels of phonological structure, however, are not distinct. Many onsets in English are single phonemes, and so are some rimes (e.g. sea, go, zoo).

The early availability of onsets and rimes is supported by studies that have compared the development of phonological awareness of onsets, rimes, and phonemes in the same subjects using the same phonological awareness tasks. For example, a study by Treiman and Zudowski used a same/different judgement task based on the beginning or the end sounds of words. In the beginning sound task, the words either began with the same onset, as in plea and plank, or shared only the initial phoneme, as in plea and pry. In the endsound task, the words either shared the entire rime, as in spit and wit, or shared only the final phoneme, as in rat and wit. Treiman and Zudowski showed that 4–and 5–year old children found the onset-rime version of the same/different task significantly easier than the version based on phonemes. Only the 6-yearolds, who had been learning to read for about a year, were able to perform both versions of the tasks with an equal level of success.

From the following statements, pick out the true statement according to the passage:

A. A mono-syllabic word can have only one onset.
B. A mono-syllabic word can have only one rhyme but more than one rime.
C. A mono-syllabic word can have only one phoneme.
D. All of the above.

Only the 6-yearolds, who had been learning to read for about a year, were able to perform both versions of the tasks with an equal level of success.

A phonological deficit in which of the following is likely to be classified as dyslexia?

A. Phonemic judgement
B. Onset judgement
C. Rime judgement
D. Any one or more of the above

cat2001 verbal-ability passage-reading

## 5.16.52 Passage Reading: CAT 2001 | Question: 79 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

Studies of the factors governing reading development in young children have achieved a remarkable degree of consensus over the past two decades. This consensus concerns the causal role of phonological skills in young children's reading progress. Children who have poor phonological skills, progress more poorly. In particular, those who have a specific phonological deficit are likely to be classified as dyslexic by the time that they are 9 or 10 years old.

Phonological skills in young children can be measured at a number of different levels. The term phonological awareness is a global one, and refers to a deficit in recognising smaller units of sound within spoken words. Developmental work has shown that this deficit can be at the level of syllables, of onsets and rimes, or of phonemes. For example, a 4-year old child might have difficulty in recognising that a word like valentine has three syllables, suggesting a lack of syllabic awareness. A 5 year old might have difficulty in recognising that the odd word out in the set of words fan, cat, hat, mat is fan. This task requires an awareness of the sub-syllabic units of the onset and the rime. The onset corresponds to any initial consonants is a syllable, and the rime corresponds to the vowel and to any following consonants. Rimes correspond to rhyme in single-syllable words, and so the rime in fan differs from the rime in cat, hat, and mat. In longer words, rime and rhyme may differ. The onsets in val : en : tine are /v/ and /t/, and the rimes correspond to the spelling patterns 'al', 'en', and 'ine'.

A 6-year-old might have difficulty in recognising that plea and pray begin with the same initial sound. This is a phonemic judgement. Although the initial phoneme /p/ is shared between the two words, in plea it is part of onset 'pl', and in pray it is part of the onset 'pr'. Until children can segment the onset (or the rime), such phonemic judgements are difficult for them to make. In fact, a recent survey of different developmental studies has shown that the different levels of phonological awareness appear to emerge sequentially. The awareness of syllables, onsets, and rimes appears to emerge at around the ages of 3 and 4, long before most children go to school. The awareness of phonemes, on the other hand, usually emerges at around the age of 5 or 6, when children have been taught to read for about a year. An awareness of onsets and rimes thus appears to be a precursor of reading, whereas an awareness of phonemes at every serial position in a word only appears to develop as reading is taught. The onsetrime and phonemic levels of phonological structure, however, are not distinct. Many onsets in English are single phonemes, and so are some rimes (e.g. sea, go, zoo).

The early availability of onsets and rimes is supported by studies that have compared the development of phonological awareness of onsets, rimes, and phonemes in the same subjects using the same phonological awareness tasks. For example, a study by Treiman and Zudowski used a same/different judgement task based on the beginning or the end sounds of words. In the beginning sound task, the words either began with the same onset, as in plea and plank, or shared only the initial phoneme, as in plea and pry. In the endsound task, the words either shared the entire rime, as in spit and wit, or shared only the final phoneme, as in rat and wit. Treiman and Zudowski showed that 4–and 5–year old children found the onset-rime version of the same/different task significantly easier than the version based on phonemes. Only the 6-yearolds, who had been learning to read for about a year, were able to perform both versions of the tasks with an equal level of success.

The Treiman and Zudowski experiment found evidence to support the following:

A. at age 6, reading instruction helps children perform, both, the same-different judgement task.
B. the development of onset-rime awareness precedes the development of an awareness of phonemes.
C. at age 4 − 5 children find the onset-rime version of the same/different task significantly easier.
D. the development of onset-rime awareness is a necessary and sufficient condition for the development of an awareness of phonemes.

cat2001 verbal-ability passage-reading

## 5.16.53 Passage Reading: CAT 2001 | Question: 80 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

Studies of the factors governing reading development in young children have achieved a remarkable degree of consensus over the past two decades. This consensus concerns the causal role of phonological skills in young children's reading progress. Children who have poor phonological skills, progress more poorly. In particular, those who have a specific phonological deficit are likely to be classified as dyslexic by the time that they are 9 or 10 years old.

Phonological skills in young children can be measured at a number of different levels. The term phonological awareness is a global one, and refers to a deficit in recognising smaller units of sound within spoken words. Developmental work has shown that this deficit can be at the level of syllables, of onsets and rimes, or of phonemes. For example, a 4-year old child might have difficulty in recognising that a word like valentine has three syllables, suggesting a lack of syllabic awareness. A 5 year old might have difficulty in recognising that the odd word out in the set of words fan, cat, hat, mat is fan. This task requires an awareness of the sub-syllabic units of the onset and the rime. The onset corresponds to any initial consonants is a syllable, and the rime corresponds to the vowel and to any following consonants. Rimes correspond to rhyme in single-syllable words, and so the rime in fan differs from the rime in cat, hat, and mat. In longer words, rime and rhyme may differ. The onsets in val : en : tine are /v/ and /t/, and the rimes correspond to the spelling patterns 'al', 'en', and 'ine'.

A 6-year-old might have difficulty in recognising that plea and pray begin with the same initial sound. This is a phonemic judgement. Although the initial phoneme /p/ is shared between the two words, in plea it is part of onset 'pl', and in pray it is part of the onset 'pr'. Until children can segment the onset (or the rime), such phonemic judgements are difficult for them to make. In fact, a recent survey of different developmental studies has shown that the different levels of phonological awareness

appear to emerge sequentially. The awareness of syllables, onsets, and rimes appears to emerge at around the ages of 3 and 4, long before most children go to school. The awareness of phonemes, on the other hand, usually emerges at around the age of 5 or 6, when children have been taught to read for about a year. An awareness of onsets and rimes thus appears to be a precursor of reading, whereas an awareness of phonemes at every serial position in a word only appears to develop as reading is taught. The onsetrime and phonemic levels of phonological structure, however, are not distinct. Many onsets in English are single phonemes, and so are some rimes (e.g. sea, go, zoo).

The early availability of onsets and rimes is supported by studies that have compared the development of phonological awareness of onsets, rimes, and phonemes in the same subjects using the same phonological awareness tasks. For example, a study by Treiman and Zudowski used a same/different judgement task based on the beginning or the end sounds of words. In the beginning sound task, the words either began with the same onset, as in plea and plank, or shared only the initial phoneme, as in plea and pry. In the endsound task, the words either shared the entire rime, as in spit and wit, or shared only the final phoneme, as in rat and wit. Treiman and Zudowski showed that 4–and 5–year old children found the onset-rime version of the same/different task significantly easier than the version based on phonemes. Only the 6-yearolds, who had been learning to read for about a year, were able to perform both versions of the tasks with an equal level of success.

The single-syllable words Rhyme and Rime are constituted by the exact same set of

A. rime (s) B. onset (s) C. rhyme (s) D. phonemes (s)

A. AB.BAC.CAD.BBCC, D

## 5.16.54 Passage Reading: CAT 2001 | Question: 81 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

Billie Holiday died a few weeks ago. I have been unable until now to write about her, but since she will survive many who receive longer obituaries, a short delay in one small appreciation will not harm her or us. When she died we the musicians, critics, all who were ever transfixed by the most heart-rending voice of the past generation–grieved bitterly. There was no reason to. Few people pursued self-destruction more wholeheartedly then she, and when the pursuit was at an end, at the age of forty-four, she had turned herself into a physical and artistic wreck. Some of us tried gallantly to pretend otherwise, taking comfort in the occasional moments when she still sounded like a ravaged echo of her greatness. Others had not even the heart to see and listen any more. We preferred to stay home and, if old and lucky enough to own the incomparable records of her heyday from 1937 to 1946, many of which are not even available on British LP, to recreate those coarse-textured, sinuous, and unbearable sad noises which gave her a sure corner of immortality. Her physical death called, if anything, for relief rather than sorrow. What sort of middle age would she have faced without the voice to earn money for her drinks and fixes, without the looks and in her day she was hauntingly beautiful to attract the men she needed, without business sense, without anything but the disinterested worship of ageing men had heard and seen her in her glory?

And yet, irrational though it is, our grief expressed Billie Holiday's art, that of a woman for whom one must be sorry. The great blues singers, to whom she may be justly compared, played their game from strength. Lionesses, though often wounded or at bay (did not Bessie Smith call herself 'a tiger, ready to jump'?), their tragic equivalents were Cleopatra and Phaedra; Holiday's was an embittered Ophelia. She was the Puccini heroine among blues singers, or rather among jazz singers, for though she sang a cabaret version of the blues incomparably, her natural idiom was the pop song. Her unique achievement was to have twisted this into a genuine expression of the major passions by means of a total disregard of its sugary tunes, or indeed or any tune other than her own few delicately crying elongated notes, phrased like Bessie Smith or Louis Armstrong in sackcloth, song in a thin, gritty, haunting voice whose natural mood was an unresigned and voluptuous welcome for the pains of love. Nobody has sung, or will sing, Bess's songs from Porgy as she did. It was this combination of bitterness and physical submission, as of someone lying still while watching his legs being amputated, which gives such a bloodcurdling quality to her Strange Fruit, the antilynching poem which she turned into an unforgettable art song. Suffering was her profession; but she did not accept it.

Little need be said about her horrifying life, which she described with emotional, though hardly with factual, truth in her autobiography Lady Sings the Blues. After an adolescence in which self-respect was measured by a girl's insistence on picking up the coins thrown on her by clients with her hands, she was plainly beyond help. She did not lack it, for she had the flair and scrupulous honesty of John Hammond to launch her, the best musicians of the 1930s to accompany her-notably Teddy Wilson, Frankie Newton and Lester Young the boundless devotion of all serious connoisseurs, and much public success. It was too late to arrest a career of systematic embittered selfimmolation. To be born with both beauty and selfrespect in the Negro ghetto of Baltimore in 1915 was too much of a handicap, even without rape at the age of ten and drug-addiction in her teens. But, while she destroyed herself, she sang, unmelodious, profound and heartbreaking. It is impossible not to weep for her, or not to hate the world which made her what she was.

Why will Billie holiday survive many who receive longer obituaries?

A. Because of her blues creations.
B. Because she was not as self-destructive as some other blues exponents.
C. Because of her smooth and mellow voice.
D. Because of the expression of anger in her songs.

## 5.16.55 Passage Reading: CAT 2001 | Question: 82 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

Billie Holiday died a few weeks ago. I have been unable until now to write about her, but since she will survive many who receive longer obituaries, a short delay in one small appreciation will not harm her or us. When she died we the musicians, critics, all who were ever transfixed by the most heart-rending voice of the past generation–grieved bitterly. There was no reason to. Few people pursued self-destruction more wholeheartedly then she, and when the pursuit was at an end, at the age of forty-four, she had turned herself into a physical and artistic wreck. Some of us tried gallantly to pretend otherwise, taking comfort in the occasional moments when she still sounded like a ravaged echo of her greatness. Others had not even the heart to see and listen any more. We preferred to stay home and, if old and lucky enough to own the incomparable records of her heyday from 1937 to 1946, many of which are not even available on British LP, to recreate those coarse-textured, sinuous, and unbearable sad noises which gave her a sure corner of immortality. Her physical death called, if anything, for relief rather than sorrow. What sort of middle age would she have faced without the voice to earn money for her drinks and fixes, without the looks and in her day she was hauntingly beautiful to attract the men she needed, without business sense, without anything but the disinterested worship of ageing men had heard and seen her in her glory?

And yet, irrational though it is, our grief expressed Billie Holiday's art, that of a woman for whom one must be sorry. The great blues singers, to whom she may be justly compared, played their game from strength. Lionesses, though often wounded or at bay (did not Bessie Smith call herself 'a tiger, ready to jump'?), their tragic equivalents were Cleopatra and Phaedra; Holiday's was an embittered Ophelia. She was the Puccini heroine among blues singers, or rather among jazz singers, for though she sang a cabaret version of the blues incomparably, her natural idiom was the pop song. Her unique achievement was to have twisted this into a genuine expression of the major passions by means of a total disregard of its sugary tunes, or indeed or any tune other than her own few delicately crying elongated notes, phrased like Bessie Smith or Louis Armstrong in sackcloth, song in a thin, gritty, haunting voice whose natural mood was an unresigned and voluptuous welcome for the pains of love. Nobody has sung, or will sing, Bess's songs from Porgy as she did. It was this combination of bitterness and physical submission, as of someone lying still while watching his legs being amputated, which gives such a bloodcurdling quality to her Strange Fruit, the antilynching poem which she turned into an unforgettable art song. Suffering was her profession; but she did not accept it.

Little need be said about her horrifying life, which she described with emotional, though hardly with factual, truth in her autobiography Lady Sings the Blues. After an adolescence in which self-respect was measured by a girl's insistence on picking up the coins thrown on her by clients with her hands, she was plainly beyond help. She did not lack it, for she had the flair and scrupulous honesty of John Hammond to launch her, the best musicians of the 1930s to accompany her-notably Teddy Wilson, Frankie Newton and Lester Young the boundless devotion of all serious connoisseurs, and much public success. It was too late to arrest a career of systematic embittered selfimmolation. To be born with both beauty and selfrespect in the Negro ghetto of Baltimore in 1915 was too much of a handicap, even without rape at the age of ten and drug-addiction in her teens. But, while she destroyed herself, she sang, unmelodious, profound and heartbreaking. It is impossible not to weep for her, or not to hate the world which made her what she was.

According to the author, if Billie Holiday had not died in her middle age

A. she would have gone on to make a further mark.
B. she would have become even richer than what she was when she died.
C. she would have led a rather ravaged existence.
D. she would have led a rather comfortable existence.

## 5.16.56 Passage Reading: CAT 2001 | Question: 83 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

Billie Holiday died a few weeks ago. I have been unable until now to write about her, but since she will survive many who receive longer obituaries, a short delay in one small appreciation will not harm her or us. When she died we the musicians, critics, all who were ever transfixed by the most heart-rending voice of the past generation–grieved bitterly. There was no reason to. Few people pursued self-destruction more wholeheartedly then she, and when the pursuit was at an end, at the age of forty-four, she had turned herself into a physical and artistic wreck. Some of us tried gallantly to pretend otherwise, taking comfort in the occasional moments when she still sounded like a ravaged echo of her greatness. Others had not even the heart to see and listen any more. We preferred to stay home and, if old and lucky enough to own the incomparable records of her heyday from 1937 to 1946, many of which are not even available on British LP, to recreate those coarse-textured, sinuous, and unbearable sad noises which gave her a sure corner of immortality. Her physical death called, if anything, for relief rather than sorrow. What sort of middle age would she have faced without the voice to earn money for her drinks and fixes, without the looks and in her day she was hauntingly beautiful to attract the men she needed, without business sense, without anything but the disinterested worship of ageing men had heard and seen her in her glory?

And yet, irrational though it is, our grief expressed Billie Holiday's art, that of a woman for whom one must be sorry. The great blues singers, to whom she may be justly compared, played their game from strength. Lionesses, though often wounded or at bay (did not Bessie Smith call herself 'a tiger, ready to jump'?), their tragic equivalents were Cleopatra and Phaedra; Holiday's was an embittered Ophelia. She was the Puccini heroine among blues singers, or rather among jazz singers, for though she sang a cabaret version of the blues incomparably, her natural idiom was the pop song. Her unique achievement was to have twisted this into a genuine expression of the major passions by means of a total disregard of its sugary tunes, or indeed or any tune other than her own few delicately crying elongated notes, phrased like Bessie Smith or Louis Armstrong in sackcloth, song in a thin, gritty, haunting voice whose natural mood was an unresigned and voluptuous welcome for the pains of love. Nobody has sung, or will sing, Bess's songs from Porgy as she did. It was this combination of bitterness and physical submission, as of someone lying still while watching his legs being amputated, which gives such a bloodcurdling quality to her Strange Fruit, the antilynching poem which she turned into an unforgettable art song. Suffering was her profession; but she did not accept it.

Little need be said about her horrifying life, which she described with emotional, though hardly with factual, truth in her autobiography Lady Sings the Blues. After an adolescence in which self-respect was measured by a girl's insistence on picking up the coins thrown on her by clients with her hands, she was plainly beyond help. She did not lack it, for she had the flair and scrupulous honesty of John Hammond to launch her, the best musicians of the 1930s to accompany her-notably Teddy Wilson, Frankie Newton and Lester Young the boundless devotion of all serious connoisseurs, and much public success. It was too late to arrest a career of systematic embittered selfimmolation. To be born with both beauty and selfrespect in the Negro ghetto of Baltimore in 1915 was too much of a handicap, even without rape at the age of ten and drug-addiction in her teens. But, while she destroyed herself, she sang, unmelodious, profound and heartbreaking. It is impossible not to weep for her, or not to hate the world which made her what she was.

Which of the following statements is not representative of the author's opinion?

A. Billie Holiday had her unique brand of melody.
B. Billie Holiday's voice can be compared to other singers in certain ways.
C. Billie Holiday's voice had a ring of profound sorrow.
D. Billie Holiday welcomed suffering in her profession and in her life.

## 5.16.57 Passage Reading: CAT 2001 | Question: 84 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

Billie Holiday died a few weeks ago. I have been unable until now to write about her, but since she will survive many who receive longer obituaries, a short delay in one small appreciation will not harm her or us. When she died we the musicians, critics, all who were ever transfixed by the most heart-rending voice of the past generation–grieved bitterly. There was no reason to. Few people pursued self-destruction more wholeheartedly then she, and when the pursuit was at an end, at the age of forty-four, she had turned herself into a physical and artistic wreck. Some of us tried gallantly to pretend otherwise, taking comfort in the occasional moments when she still sounded like a ravaged echo of her greatness. Others had not even the heart to see and listen any more. We preferred to stay home and, if old and lucky enough to own the incomparable records of her heyday from 1937 to 1946, many of which are not even available on British LP, to recreate those coarse-textured, sinuous, and unbearable sad noises which gave her a sure corner of immortality. Her physical death called, if anything, for relief rather than sorrow. What sort of middle age would she have faced without the voice to earn money for her drinks and fixes, without the looks and in her day she was hauntingly beautiful to attract the men she needed, without business sense, without anything but the disinterested worship of ageing men had heard and seen her in her glory?

And yet, irrational though it is, our grief expressed Billie Holiday's art, that of a woman for whom one must be sorry. The great blues singers, to whom she may be justly compared, played their game from strength. Lionesses, though often wounded or at bay (did not Bessie Smith call herself 'a tiger, ready to jump'?), their tragic equivalents were Cleopatra and Phaedra; Holiday's was an embittered Ophelia. She was the Puccini heroine among blues singers, or rather among jazz singers, for though she sang a cabaret version of the blues incomparably, her natural idiom was the pop song. Her unique achievement was to have twisted this into a genuine expression of the major passions by means of a total disregard of its sugary tunes, or indeed or any tune other than her own few delicately crying elongated notes, phrased like Bessie Smith or Louis Armstrong in sackcloth, song in a thin, gritty, haunting voice whose natural mood was an unresigned and voluptuous welcome for the pains of love. Nobody has sung, or will sing, Bess's songs from Porgy as she did. It was this combination of bitterness and physical submission, as of someone lying still while watching his legs being amputated, which gives such a bloodcurdling quality to her Strange Fruit, the antilynching poem which she turned into an unforgettable art song. Suffering was her profession; but she did not accept it.

Little need be said about her horrifying life, which she described with emotional, though hardly with factual, truth in her autobiography Lady Sings the Blues. After an adolescence in which self-respect was measured by a girl's insistence on picking up the coins thrown on her by clients with her hands, she was plainly beyond help. She did not lack it, for she had the flair and scrupulous honesty of John Hammond to launch her, the best musicians of the 1930s to accompany her-notably Teddy Wilson, Frankie Newton and Lester Young the boundless devotion of all serious connoisseurs, and much public success. It was too late to arrest a career of systematic embittered selfimmolation. To be born with both beauty and selfrespect in the Negro ghetto of Baltimore in 1915 was too much of a handicap, even without rape at the age of ten and drug-addiction in her teens. But, while

she destroyed herself, she sang, unmelodious, profound and heartbreaking. It is impossible not to weep for her, or not to hate the world which made her what she was.

According to the passage, Billie Holiday was fortunate in all but one of the following ways

A. she was fortunate to have been picked up young by an honest producer.
B. she was fortunate to have the likes of Louis Armstrong and Bessie Smith accompany her.
C. she was fortunate to posses the looks.
D. she enjoyed success among the public and connoisseurs.

## 5.16.58 Passage Reading: CAT 2001 | Question: 85 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

The narrative of Dersu Uzala is divided into two major sections, set in 1902 and 1907, that deal with separate expeditions which Arseniev conducts into the Ussuri region. In addition, a third time frame forms a prologue to the film. Each of the temporal frames has a different focus and by shifting them Kurosawa is able to describe the encroachment of settlements upon the wilderness and the consequent erosion of Dersu's way of life. As the film opens, that erosion has already begun. The first image is a long shot of a huge forest, the trees piled upon one another by the effects of the telephoto lens so that the landscape becomes an abstraction and appears like a huge curtain of green. A title informs us that the year is 1910. This is as late into the century as Kurosawa will go. After this prologue, the events of the film will transpire even farther back in time and will presented as Arseniev's recollections. The character of Dersu Uzala is the heart of the film, his life the example that Kurosawa wishes to affirm. Yet the formal organisation of the film works to contain to close, to circumscribe that life by erecting a series of obstacles around it. The film itself is circular, opening and closing by Dersu's grave, thus sealing off the character from the modern world to which Kurosawa once so desperately wanted to speak. The multiple time frames also work to maintain a separation between Dersu and the contemporary world. We must go back farther even than 1910 to discover who he was. But this narrative structure has yet another implication. It safeguards Dersu's example, inoculates it from contamination with history, and protects it from contact with the industrialised, urban world. Time is organised by the narrative into a series of barriers, which enclose Dersu in a kind of vacuum chamber, protecting him from the social and historical dialectics that destroyed the other Kurosawa heroes. Within the film, Dersu does die, but the narrative structure attempts to immortalise him and his example, as Dersu passes from history into myth.

We see all this at work in the enormously evocative prologue. The camera down to reveal felled trees littering the landscape and an abundance of construction. Roads and houses outline the settlement that is being built. Kurosawa cuts to a medium shot of Arseniev standing in the midst of the clearing, looking uncomfortable and disoriented. A man passing in a wagon asks him what he is done, and the explorer says he is looking for a grave. The driver replies than no one has died here, the settlement is too recent. These words enunciate the temporal rupture that the film studies. It is the beginning of things (industrial society) and the end of things (the forest), the commencement of one world so young that no one has had time yet to die and the eclipse of another, in which Dersu has died. It is his grave for which the explorer searches. His passing symbolises the new order, the development that now surrounds Arseniev. The explorer says he buried his friend three years ago, next to huge cedar and fir trees, but now they are all gone. The man on the wagon replies they were probably chopped down when the settlement was build, and he drives off. Arseniev walks to a barren, treeless spot next to a pile of bricks. As he moves, the camera tracks and pans to follow, revealing a line of freshly built houses and a woman hanging her laundry to dry. A distant train whistle is heard, and the sounds of construction in the clearing vie with the cries of birds and the rustle of wind in the trees. Arseniev pauses, looks around for the grave that once was, and murmurs desolately, "Dersu". The image now cuts farther into the past, to 1902, and the first section of the film commences, which describes Arseniev's meeting with Dersu and their friendship.

Kurosawa defines the world of the film initially upon a void, a missing presence. The grave is gone, brushed aside by a world rushing into modernism, and nowthe hunter exists only in Arseniev's emories. The hallucinatory dreams and visions of Dodeskaden are succeeded by nostalgic, melancholy ruminations. Yet by exploring these ruminations, the film celebrates the timelessness of Dersu's wisdom. The first section of the film has two purposes: to describe the magnificence and inhuman vastness of nature and to delineate the code of ethics by which Dersu lives and which permits him to survive in these conditions. When Dersu first appears, the other soldiers treat him with condescension and laughter, but Arseniev watches him closely and does not share their derisive response. Unlike them, he is capable of immediately grasping Dersu's extraordinary qualities. In camp, Kurosawa frames Arseniev by himself, sitting on the other side of the fire from his soldiers. While they sleep or joke among themselves, he writes in his diary and Kurosawa cuts in several point-of-view shots from his perspective of trees that appear animated and sinister as the fire light dances across their gnarled, leafless outlines. This reflective dimension, this sensitivity to the spirituality of nature, distinguishes him from the others and forms the basis of his receptivity to Dersu and their friendship. It makes his a fit pupil for the hunter.

How is Kurosawa able to show the erosion on Dersu's way of life?

A. By documenting the ebb and flow of modernisation.
B. By going back farther and farther in time.
C. By using three different time frames and shifting them.

D. Through his death in a distant time.

## 5.16.61 Passage Reading: CAT 2001 | Question: 88 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

The narrative of Dersu Uzala is divided into two major sections, set in 1902 and 1907, that deal with separate expeditions which Arseniev conducts into the Ussuri region. In addition, a third time frame forms a prologue to the film. Each of the temporal frames has a different focus and by shifting them Kurosawa is able to describe the encroachment of settlements upon the wilderness and the consequent erosion of Dersu's way of life. As the film opens, that erosion has already begun. The first image is a long shot of a huge forest, the trees piled upon one another by the effects of the telephoto lens so that the landscape becomes an abstraction and appears like a huge curtain of green. A title informs us that the year is 1910. This is as late into the century as Kurosawa will go. After this prologue, the events of the film will transpire even farther back in time and will presented as Arseniev's recollections. The character of Dersu Uzala is the heart of the film, his life the example that Kurosawa

wishes to affirm. Yet the formal organisation of the film works to contain to close, to circumscribe that life by erecting a series of obstacles around it. The film itself is circular, opening and closing by Dersu's grave, thus sealing off the character from the modern world to which Kurosawa once so desperately wanted to speak. The multiple time frames also work to maintain a separation between Dersu and the contemporary world. We must go back farther even than 1910 to discover who he was. But this narrative structure has yet another implication. It safeguards Dersu's example, inoculates it from contamination with history, and protects it from contact with the industrialised, urban world. Time is organised by the narrative into a series of barriers, which enclose Dersu in a kind of vacuum chamber, protecting him from the social and historical dialectics that destroyed the other Kurosawa heroes. Within the film, Dersu does die, but the narrative structure attempts to immortalise him and his example, as Dersu passes from history into myth.

We see all this at work in the enormously evocative prologue. The camera down to reveal felled trees littering the landscape and an abundance of construction. Roads and houses outline the settlement that is being built. Kurosawa cuts to a medium shot of Arseniev standing in the midst of the clearing, looking uncomfortable and disoriented. A man passing in a wagon asks him what he is done, and the explorer says he is looking for a grave. The driver replies than no one has died here, the settlement is too recent. These words enunciate the temporal rupture that the film studies. It is the beginning of things (industrial society) and the end of things (the forest), the commencement of one world so young that no one has had time yet to die and the eclipse of another, in which Dersu has died. It is his grave for which the explorer searches. His passing symbolises the new order, the development that now surrounds Arseniev. The explorer says he buried his friend three years ago, next to huge cedar and fir trees, but now they are all gone. The man on the wagon replies they were probably chopped down when the settlement was build, and he drives off. Arseniev walks to a barren, treeless spot next to a pile of bricks. As he moves, the camera tracks and pans to follow, revealing a line of freshly built houses and a woman hanging her laundry to dry. A distant train whistle is heard, and the sounds of construction in the clearing vie with the cries of birds and the rustle of wind in the trees. Arseniev pauses, looks around for the grave that once was, and murmurs desolately, "Dersu". The image now cuts farther into the past, to 1902, and the first section of the film commences, which describes Arseniev's meeting with Dersu and their friendship.

Kurosawa defines the world of the film initially upon a void, a missing presence. The grave is gone, brushed aside by a world rushing into modernism, and nowthe hunter exists only in Arseniev's emories. The hallucinatory dreams and visions of Dodeskaden are succeeded by nostalgic, melancholy ruminations. Yet by exploring these ruminations, the film celebrates the timelessness of Dersu's wisdom. The first section of the film has two purposes: to describe the magnificence and inhuman vastness of nature and to delineate the code of ethics by which Dersu lives and which permits him to survive in these conditions. When Dersu first appears, the other soldiers treat him with condescension and laughter, but Arseniev watches him closely and does not share their derisive response. Unlike them, he is capable of immediately grasping Dersu's extraordinary qualities. In camp, Kurosawa frames Arseniev by himself, sitting on the other side of the fire from his soldiers. While they sleep or joke among themselves, he writes in his diary and Kurosawa cuts in several point-of-view shots from his perspective of trees that appear animated and sinister as the fire light dances across their gnarled, leafless outlines. This reflective dimension, this sensitivity to the spirituality of nature, distinguishes him from the others and forms the basis of his receptivity to Dersu and their friendship. It makes his a fit pupil for the hunter.

According to the author the section of the film following the prologue

A. serves to highlight the difficulties that Dersu faces that eventually kills him.
B. shows the difference in thinking between Arseniev and Dersu.
C. shows the code by which Dersu lives that allows him to survive his surroundings.
D. serves to criticize the lack of understanding of nature in the pre-modern era.

## 5.16.62 Passage Reading: CAT 2001 | Question: 89 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

The narrative of Dersu Uzala is divided into two major sections, set in 1902 and 1907, that deal with separate expeditions which Arseniev conducts into the Ussuri region. In addition, a third time frame forms a prologue to the film. Each of the temporal frames has a different focus and by shifting them Kurosawa is able to describe the encroachment of settlements upon the wilderness and the consequent erosion of Dersu's way of life. As the film opens, that erosion has already begun. The first image is a long shot of a huge forest, the trees piled upon one another by the effects of the telephoto lens so that the landscape becomes an abstraction and appears like a huge curtain of green. A title informs us that the year is 1910. This is as late into the century as Kurosawa will go. After this prologue, the events of the film will transpire even farther back in time and will presented as Arseniev's recollections. The character of Dersu Uzala is the heart of the film, his life the example that Kurosawa wishes to affirm. Yet the formal organisation of the film works to contain to close, to circumscribe that life by erecting a series of obstacles around it. The film itself is circular, opening and closing by Dersu's grave, thus sealing off the character from the modern world to which Kurosawa once so desperately wanted to speak. The multiple time frames also work to maintain a separation between Dersu and the contemporary world. We must go back farther even than 1910 to discover who he was. But this narrative structure has yet another implication. It safeguards Dersu's example, inoculates it from contamination with history, and protects it from contact with the industrialised, urban world. Time is organised by the narrative into a series of barriers, which enclose Dersu in a kind of vacuum chamber, protecting him from the social and historical dialectics that destroyed the other Kurosawa heroes. Within the film, Dersu does die, but the narrative structure attempts to immortalise him

and his example, as Dersu passes from history into myth.

We see all this at work in the enormously evocative prologue. The camera down to reveal felled trees littering the landscape and an abundance of construction. Roads and houses outline the settlement that is being built. Kurosawa cuts to a medium shot of Arseniev standing in the midst of the clearing, looking uncomfortable and disoriented. A man passing in a wagon asks him what he is done, and the explorer says he is looking for a grave. The driver replies than no one has died here, the settlement is too recent. These words enunciate the temporal rupture that the film studies. It is the beginning of things (industrial society) and the end of things (the forest), the commencement of one world so young that no one has had time yet to die and the eclipse of another, in which Dersu has died. It is his grave for which the explorer searches. His passing symbolises the new order, the development that now surrounds Arseniev. The explorer says he buried his friend three years ago, next to huge cedar and fir trees, but now they are all gone. The man on the wagon replies they were probably chopped down when the settlement was build, and he drives off. Arseniev walks to a barren, treeless spot next to a pile of bricks. As he moves, the camera tracks and pans to follow, revealing a line of freshly built houses and a woman hanging her laundry to dry. A distant train whistle is heard, and the sounds of construction in the clearing vie with the cries of birds and the rustle of wind in the trees. Arseniev pauses, looks around for the grave that once was, and murmurs desolately, “Dersu”. The image now cuts farther into the past, to 1902, and the first section of the film commences, which describes Arseniev’s meeting with Dersu and their friendship.

Kurosawa defines the world of the film initially upon a void, a missing presence. The grave is gone, brushed aside by a world rushing into modernism, and nowthe hunter exists only in Arseniev’s emories. The hallucinatory dreams and visions of Dodeskaden are succeeded by nostalgic, melancholy ruminations. Yet by exploring these ruminations, the film celebrates the timelessness of Dersu’s wisdom. The first section of the film has two purposes: to describe the magnificence and inhuman vastness of nature and to delineate the code of ethics by which Dersu lives and which permits him to survive in these conditions. When Dersu first appears, the other soldiers treat him with condescension and laughter, but Arseniev watches him closely and does not share their derisive response. Unlike them, he is capable of immediately grasping Dersu’s extraordinary qualities. In camp, Kurosawa frames Arseniev by himself, sitting on the other side of the fire from his soldiers. While they sleep or joke among themselves, he writes in his diary and Kurosawa cuts in several point-of-view shots from his perspective of trees that appear animated and sinister as the fire light dances across their gnarled, leafless outlines. This reflective dimension, this sensitivity to the spirituality of nature, distinguishes him from the others and forms the basis of his receptivity to Dersu and their friendship. It makes his a fit pupil for the hunter.

In the film, Kurosawa hints at Arseniev’s reflective and sensitive nature

A. by showing him as not being derisive towards Dersu, unlike other soldiers.
B. by showing him as being aloof from other soldiers.
C. through shots of Arseniev writing his diary, framed by trees.
D. all of the above.

## 5.16.64 Passage Reading: CAT 2001 | Question: 91 top

**The passage given below is followed by a question. Choose the best answer from the options given.**

The passage given below is followed by questions. Choose the best answer for each question.

Democracy rests on a tension between two different principles. There is, on the one hand, the principle of equality before the law, or, more generally, of equality, and, on the other, what may be described as the leadership principle. The first gives priority to rules and the second to persons. No matter how skilfully we contrive our schemes; there is a point beyond which the one principle cannot be promoted without some sacrifice of the other.

Alexis de Tocqueville, the great nineteenth century writer on democracy, maintained that the age of democracy, whose birth he was witnessing, would also be the age of mediocrity: in saying this he was thinking primarily of a regime of equality governed by impersonal rules. Despite his strong attachment to democracy, he took great pains to point out what he believed to be its negative side: a dead level plane of achievement in practically every sphere of life. The age of democracy would, in his view, be an unheroic age; there would not be room in it for either heroes or hero-worshippers.

But modern democracies have not been able to do without heroes: this too was foreseen, with much misgiving, by Tocqueville. Tocqueville viewed this with misgiving because he believed, rightly or wrongly, that unlike in aristocratic societies there was no proper place in a democracy for heroes and, hence, when they arose they would sooner or later turn into despots. Whether they require heroes or not, democracies certainly require leaders, and, in the contemporary age, breed them in great profusion; the problem is to know what to do with them.

In a world preoccupied with scientific rationality the advantages of a system based on an impersonal rule of law should be a recommendation with everybody. There is something orderly and predictable about such a system. When life is lived mainly in small, selfcontained communities, men are able to take finer personal distinctions into account in dealing with their fellow men. They are unable to do this in a large and amorphous society, and organised living would be impossible here without a system of impersonal rules. Above all, such a system guarantees a kind of equality to the extent that everybody, no matter in what station of life, is bound by the same explicit, often written, rules, and nobody is above them.

But a system governed solely by impersonal rules can at best ensure order and stability; it cannot create any shining vision of a future in which mere formal equality will be replaced by real equality and fellowship. A world governed by impersonal rules cannot easily change itself, or when it does, the change is so gradual as to make the basic and fundamental feature of society appear unchanged. For any kind of basic or fundamental change, a push is needed from within, a kind of individual initiative which will create new rules, new terms and conditions of life.

The issue of leadership thus acquires crucial significance in the context of change. If the modern age is preoccupied with scientific rationality, it is no less preoccupied with change. To accept what exists on its own terms is traditional, not modern, and it may be all very well to appreciate tradition in music, dance and drama, but for society as a whole the choice has already

been made in favour of modernisation and development. Moreover, in some countries the gap between ideal and reality has become so great that the argument for development and change is now irresistible.

In these countries no argument for development has greater appeal to urgency than the one which shows development to be the condition for the mitigation, if not the elimination, of inequality. There is something contradictory about the very presence of large inequalities in a society which professes to be democratic. It does not take people too long to realise that democracy by itself can guarantee only formal equality; beyond this, it can only whet people's appetite for real or substantive equality. From this arises their continued preoccupation with plans and schemes that will help to bridge the gap between the ideal of equality and the reality which is so contrary to it.

When pre-existing rules give no clear directions of change, leadership comes into its own. Every democracy invests its leadership with a measure of harisma, and expects from it a corresponding measure of energy and vitality. Now, the greater the urge for change in a society the stronger the appeal of a dynamic leadership in it. A dynamic leadership seeks to free itself from the constraints of existing rules; in a sense that is the test of dynamism. In this process it may take a turn at which it ceases to regard itself as being bound by these rules, placing itself above them. There is always a tension between 'charisma' and 'discipline' in the case of a democratic leadership, and when this leadership puts forward revolutionary claims, the tension tends to be resolved at the expense of discipline.

Characteristically, the legitimacy of such a leadership rests on its claim to be able to abolish or at least substantially reduce the existing inequalities in society. From the argument that formal equality or equality before the law is but a limited good, it is often one short step to the argument that it is a hindrance or an obstacle to the establishment of real or substantive equality. The conflict between a 'progressive' executive and a 'conservative' judiciary is but one aspect of this larger problem. This conflict naturally acquires added piquancy when the executive is elected and the judiciary appointed.

Dynamic leaders are needed in democracies because

A. they have adopted the principles of 'formal' equality rather than 'substantive' equality.
B. 'formal' equality whets people's appetite for 'substantive' equality.
C. systems that rely on the impersonal rules of 'formal' equality lose their ability to make large changes.
D. of the conflict between a 'progressive' executive and a 'conservative' judiciary.

## 5.16.65 Passage Reading: CAT 2001 | Question: 92 top

**The passage given below is followed by a question. Choose the best answer from the options given.**

The passage given below is followed by questions. Choose the best answer for each question.

Democracy rests on a tension between two different principles. There is, on the one hand, the principle of equality before the law, or, more generally, of equality, and, on the other, what may be described as the leadership principle. The first gives priority to rules and the second to persons. No matter how skilfully we contrive our schemes; there is a point beyond which the one principle cannot be promoted without some sacrifice of the other.

Alexis de Tocqueville, the great nineteenth century writer on democracy, maintained that the age of democracy, whose birth he was witnessing, would also be the age of mediocrity: in saying this he was thinking primarily of a regime of equality governed by impersonal rules. Despite his strong attachment to democracy, he took great pains to point out what he believed to be its negative side: a dead level plane of achievement in practically every sphere of life. The age of democracy would, in his view, be an unheroic age; there would not be room in it for either heroes or hero-worshippers.

But modern democracies have not been able to do without heroes: this too was foreseen, with much misgiving, by Tocqueville. Tocqueville viewed this with misgiving because he believed, rightly or wrongly, that unlike in aristocratic societies there was no proper place in a democracy for heroes and, hence, when they arose they would sooner or later turn into despots. Whether they require heroes or not, democracies certainly require leaders, and, in the contemporary age, breed them in great profusion; the problem is to know what to do with them.

In a world preoccupied with scientific rationality the advantages of a system based on an impersonal rule of law should be a recommendation with everybody. There is something orderly and predictable about such a system. When life is lived mainly in small, selfcontained communities, men are able to take finer personal distinctions into account in dealing with their fellow men. They are unable to do this in a large and amorphous society, and organised living would be impossible here without a system of impersonal rules. Above all, such a system guarantees a kind of equality to the extent that everybody, no matter in what station of life, is bound by the same explicit, often written, rules, and nobody is above them.

But a system governed solely by impersonal rules can at best ensure order and stability; it cannot create any shining vision of a future in which mere formal equality will be replaced by real equality and fellowship. A world governed by impersonal rules cannot easily change itself, or when it does, the change is so gradual as to make the basic and fundamental feature of society appear unchanged. For any kind of basic or fundamental change, a push is needed from within, a kind of individual initiative which will create new rules, new terms and conditions of life.

The issue of leadership thus acquires crucial significance in the context of change. If the modern age is preoccupied with scientific rationality, it is no less preoccupied with change. To accept what exists on its own terms is traditional, not modern,

and it may be all very well to appreciate tradition in music, dance and drama, but for society as a whole the choice has already been made in favour of modernisation and development. Moreover, in some countries the gap between ideal and reality has become so great that the argument for development and change is now irresistible.

In these countries no argument for development has greater appeal to urgency than the one which shows development to be the condition for the mitigation, if not the elimination, of inequality. There is something contradictory about the very presence of large inequalities in a society which professes to be democratic. It does not take people too long to realise that democracy by itself can guarantee only formal equality; beyond this, it can only whet people's appetite for real or substantive equality. From this arises their continued preoccupation with plans and schemes that will help to bridge the gap between the ideal of equality and the reality which is so contrary to it.

When pre-existing rules give no clear directions of change, leadership comes into its own. Every democracy invests its leadership with a measure of harisma, and expects from it a corresponding measure of energy and vitality. Now, the greater the urge for change in a society the stronger the appeal of a dynamic leadership in it. A dynamic leadership seeks to free itself from the constraints of existing rules; in a sense that is the test of dynamism. In this process it may take a turn at which it ceases to regard itself as being bound by these rules, placing itself above them. There is always a tension between 'charisma' and 'discipline' in the case of a democratic leadership, and when this leadership puts forward revolutionary claims, the tension tends to be resolved at the expense of discipline.

Characteristically, the legitimacy of such a leadership rests on its claim to be able to abolish or at least substantially reduce the existing inequalities in society. From the argument that formal equality or equality before the law is but a limited good, it is often one short step to the argument that it is a hindrance or an obstacle to the establishment of real or substantive equality. The conflict between a 'progressive' executive and a 'conservative' judiciary is but one aspect of this larger problem. This conflict naturally acquires added piquancy when the executive is elected and the judiciary appointed.

What possible factor would a dynamic leader consider a 'hindrance' in achieving the development goals of a nation?

A. Principle of equality before the law.
B. Judicial activism.
C. A conservative judiciary.
D. Need for discipline.

## 5.16.66 Passage Reading: CAT 2001 | Question: 93 top

**The passage given below is followed by a question. Choose the best answer from the options given.**

The passage given below is followed by questions. Choose the best answer for each question.

Democracy rests on a tension between two different principles. There is, on the one hand, the principle of equality before the law, or, more generally, of equality, and, on the other, what may be described as the leadership principle. The first gives priority to rules and the second to persons. No matter how skilfully we contrive our schemes; there is a point beyond which the one principle cannot be promoted without some sacrifice of the other.

Alexis de Tocqueville, the great nineteenth century writer on democracy, maintained that the age of democracy, whose birth he was witnessing, would also be the age of mediocrity: in saying this he was thinking primarily of a regime of equality governed by impersonal rules. Despite his strong attachment to democracy, he took great pains to point out what he believed to be its negative side: a dead level plane of achievement in practically every sphere of life. The age of democracy would, in his view, be an unheroic age; there would not be room in it for either heroes or hero-worshippers.

But modern democracies have not been able to do without heroes: this too was foreseen, with much misgiving, by Tocqueville. Tocqueville viewed this with misgiving because he believed, rightly or wrongly, that unlike in aristocratic societies there was no proper place in a democracy for heroes and, hence, when they arose they would sooner or later turn into despots. Whether they require heroes or not, democracies certainly require leaders, and, in the contemporary age, breed them in great profusion; the problem is to know what to do with them.

In a world preoccupied with scientific rationality the advantages of a system based on an impersonal rule of law should be a recommendation with everybody. There is something orderly and predictable about such a system. When life is lived mainly in small, selfcontained communities, men are able to take finer personal distinctions into account in dealing with their fellow men. They are unable to do this in a large and amorphous society, and organised living would be impossible here without a system of impersonal rules. Above all, such a system guarantees a kind of equality to the extent that everybody, no matter in what station of life, is bound by the same explicit, often written, rules, and nobody is above them.

But a system governed solely by impersonal rules can at best ensure order and stability; it cannot create any shining vision of a future in which mere formal equality will be replaced by real equality and fellowship. A world governed by impersonal rules cannot easily change itself, or when it does, the change is so gradual as to make the basic and fundamental feature of society appear unchanged. For any kind of basic or fundamental change, a push is needed from within, a kind of individual initiative which will create new rules, new terms and conditions of life.

The issue of leadership thus acquires crucial significance in the context of change. If the modern age is preoccupied with scientific rationality, it is no less preoccupied with change. To accept what exists on its own terms is traditional, not modern, and it may be all very well to appreciate tradition in music, dance and drama, but for society as a whole the choice has already been made in favour of modernisation and development. Moreover, in some countries the gap between ideal and reality has become so great that the argument for development and change is now irresistible.

In these countries no argument for development has greater appeal to urgency than the one which shows development to be the condition for the mitigation, if not the elimination, of inequality. There is something contradictory about the very presence of large inequalities in a society which professes to be democratic. It does not take people too long to realise that democracy by itself can guarantee only formal equality; beyond this, it can only whet people's appetite for real or substantive equality. From this arises their continued preoccupation with plans and schemes that will help to bridge the gap between the ideal of equality and the reality which is so contrary to it.

When pre-existing rules give no clear directions of change, leadership comes into its own. Every democracy invests its leadership with a measure of harisma, and expects from it a corresponding measure of energy and vitality. Now, the greater the urge for change in a society the stronger the appeal of a dynamic leadership in it. A dynamic leadership seeks to free itself from the constraints of existing rules; in a sense that is the test of dynamism. In this process it may take a turn at which it ceases to regard itself as being bound by these rules, placing itself above them. There is always a tension between 'charisma' and 'discipline' in the case of a democratic leadership, and when this leadership puts forward revolutionary claims, the tension tends to be resolved at the expense of discipline.

Characteristically, the legitimacy of such a leadership rests on its claim to be able to abolish or at least substantially reduce the existing inequalities in society. From the argument that formal equality or equality before the law is but a limited good, it is often one short step to the argument that it is a hindrance or an obstacle to the establishment of real or substantive equality. The conflict between a 'progressive' executive and a 'conservative' judiciary is but one aspect of this larger problem. This conflict naturally acquires added piquancy when the executive is elected and the judiciary appointed.

Which of the following four statements can be inferred from the above passage?

A. Scientific rationality is an essential feature of modernity.
B. Scientific rationality results in the development of impersonal rules.
C. Modernisation and development have been chosen over traditional music, dance and drama.
D. Democracies aspire to achieve substantive equality.

A. A, B, D but not C
B. A, B but not C, D
C. A, D but not B, C
D. A, B, C but not D

## 5.16.67 Passage Reading: CAT 2001 | Question: 94 top

**The passage given below is followed by a question. Choose the best answer from the options given.**

The passage given below is followed by questions. Choose the best answer for each question.

Democracy rests on a tension between two different principles. There is, on the one hand, the principle of equality before the law, or, more generally, of equality, and, on the other, what may be described as the leadership principle. The first gives priority to rules and the second to persons. No matter how skilfully we contrive our schemes; there is a point beyond which the one principle cannot be promoted without some sacrifice of the other.

Alexis de Tocqueville, the great nineteenth century writer on democracy, maintained that the age of democracy, whose birth he was witnessing, would also be the age of mediocrity: in saying this he was thinking primarily of a regime of equality governed by impersonal rules. Despite his strong attachment to democracy, he took great pains to point out what he believed to be its negative side: a dead level plane of achievement in practically every sphere of life. The age of democracy would, in his view, be an unheroic age; there would not be room in it for either heroes or hero-worshippers.

But modern democracies have not been able to do without heroes: this too was foreseen, with much misgiving, by Tocqueville. Tocqueville viewed this with misgiving because he believed, rightly or wrongly, that unlike in aristocratic societies there was no proper place in a democracy for heroes and, hence, when they arose they would sooner or later turn into despots. Whether they require heroes or not, democracies certainly require leaders, and, in the contemporary age, breed them in great profusion; the problem is to know what to do with them.

In a world preoccupied with scientific rationality the advantages of a system based on an impersonal rule of law should be a recommendation with everybody. There is something orderly and predictable about such a system. When life is lived mainly in small, selfcontained communities, men are able to take finer personal distinctions into account in dealing with their fellow men. They are unable to do this in a large and amorphous society, and organised living would be impossible here without a system of impersonal rules. Above all, such a system guarantees a kind of equality to the extent that everybody, no matter in what station of life, is bound by the same explicit, often written, rules, and nobody is above them.

But a system governed solely by impersonal rules can at best ensure order and stability; it cannot create any shining vision of a future in which mere formal equality will be replaced by real equality and fellowship. A world governed by impersonal rules cannot easily change itself, or when it does, the change is so gradual as to make the basic and fundamental feature of society appear unchanged. For any kind of basic or fundamental change, a push is needed from within, a kind of individual initiative which will create new rules, new terms and conditions of life.

The issue of leadership thus acquires crucial significance in the context of change. If the modern age is preoccupied with scientific rationality, it is no less preoccupied with change. To accept what exists on its own terms is traditional, not modern, and it may be all very well to appreciate tradition in music, dance and drama, but for society as a whole the choice has already been made in favour of modernisation and development. Moreover, in some countries the gap between ideal and reality has

become so great that the argument for development and change is now irresistible.

In these countries no argument for development has greater appeal to urgency than the one which shows development to be the condition for the mitigation, if not the elimination, of inequality. There is something contradictory about the very presence of large inequalities in a society which professes to be democratic. It does not take people too long to realise that democracy by itself can guarantee only formal equality; beyond this, it can only whet people's appetite for real or substantive equality. From this arises their continued preoccupation with plans and schemes that will help to bridge the gap between the ideal of equality and the reality which is so contrary to it.

When pre-existing rules give no clear directions of change, leadership comes into its own. Every democracy invests its leadership with a measure of harisma, and expects from it a corresponding measure of energy and vitality. Now, the greater the urge for change in a society the stronger the appeal of a dynamic leadership in it. A dynamic leadership seeks to free itself from the constraints of existing rules; in a sense that is the test of dynamism. In this process it may take a turn at which it ceases to regard itself as being bound by these rules, placing itself above them. There is always a tension between 'charisma' and 'discipline' in the case of a democratic leadership, and when this leadership puts forward revolutionary claims, the tension tends to be resolved at the expense of discipline.

Characteristically, the legitimacy of such a leadership rests on its claim to be able to abolish or at least substantially reduce the existing inequalities in society. From the argument that formal equality or equality before the law is but a limited good, it is often one short step to the argument that it is a hindrance or an obstacle to the establishment of real or substantive equality. The conflict between a 'progressive' executive and a 'conservative' judiciary is but one aspect of this larger problem. This conflict naturally acquires added piquancy when the executive is elected and the judiciary appointed.

Tocqueville believed that the age of democracy would be an unheroic age because

A. democratic principles do not encourage heroes.
B. there is no urgency for development in democratic countries.
C. heroes that emerged in democracies would become despots.
D. aristocratic society had a greater ability to produce heroes.

cat2001 verbal-ability passage-reading

## 5.16.68 Passage Reading: CAT 2001 | Question: 95 top

**The passage given below is followed by a question. Choose the best answer from the options given.**

The passage given below is followed by questions. Choose the best answer for each question.

Democracy rests on a tension between two different principles. There is, on the one hand, the principle of equality before the law, or, more generally, of equality, and, on the other, what may be described as the leadership principle. The first gives priority to rules and the second to persons. No matter how skilfully we contrive our schemes; there is a point beyond which the one principle cannot be promoted without some sacrifice of the other.

Alexis de Tocqueville, the great nineteenth century writer on democracy, maintained that the age of democracy, whose birth he was witnessing, would also be the age of mediocrity: in saying this he was thinking primarily of a regime of equality governed by impersonal rules. Despite his strong attachment to democracy, he took great pains to point out what he believed to be its negative side: a dead level plane of achievement in practically every sphere of life. The age of democracy would, in his view, be an unheroic age; there would not be room in it for either heroes or hero-worshippers.

But modern democracies have not been able to do without heroes: this too was foreseen, with much misgiving, by Tocqueville. Tocqueville viewed this with misgiving because he believed, rightly or wrongly, that unlike in aristocratic societies there was no proper place in a democracy for heroes and, hence, when they arose they would sooner or later turn into despots. Whether they require heroes or not, democracies certainly require leaders, and, in the contemporary age, breed them in great profusion; the problem is to know what to do with them.

In a world preoccupied with scientific rationality the advantages of a system based on an impersonal rule of law should be a recommendation with everybody. There is something orderly and predictable about such a system. When life is lived mainly in small, selfcontained communities, men are able to take finer personal distinctions into account in dealing with their fellow men. They are unable to do this in a large and amorphous society, and organised living would be impossible here without a system of impersonal rules. Above all, such a system guarantees a kind of equality to the extent that everybody, no matter in what station of life, is bound by the same explicit, often written, rules, and nobody is above them.

But a system governed solely by impersonal rules can at best ensure order and stability; it cannot create any shining vision of a future in which mere formal equality will be replaced by real equality and fellowship. A world governed by impersonal rules cannot easily change itself, or when it does, the change is so gradual as to make the basic and fundamental feature of society appear unchanged. For any kind of basic or fundamental change, a push is needed from within, a kind of individual initiative which will create new rules, new terms and conditions of life.

The issue of leadership thus acquires crucial significance in the context of change. If the modern age is preoccupied with scientific rationality, it is no less preoccupied with change. To accept what exists on its own terms is traditional, not modern, and it may be all very well to appreciate tradition in music, dance and drama, but for society as a whole the choice has already

been made in favour of modernisation and development. Moreover, in some countries the gap between ideal and reality has become so great that the argument for development and change is now irresistible.

In these countries no argument for development has greater appeal to urgency than the one which shows development to be the condition for the mitigation, if not the elimination, of inequality. There is something contradictory about the very presence of large inequalities in a society which professes to be democratic. It does not take people too long to realise that democracy by itself can guarantee only formal equality; beyond this, it can only whet people's appetite for real or substantive equality. From this arises their continued preoccupation with plans and schemes that will help to bridge the gap between the ideal of equality and the reality which is so contrary to it.

When pre-existing rules give no clear directions of change, leadership comes into its own. Every democracy invests its leadership with a measure of harisma, and expects from it a corresponding measure of energy and vitality. Now, the greater the urge for change in a society the stronger the appeal of a dynamic leadership in it. A dynamic leadership seeks to free itself from the constraints of existing rules; in a sense that is the test of dynamism. In this process it may take a turn at which it ceases to regard itself as being bound by these rules, placing itself above them. There is always a tension between 'charisma' and 'discipline' in the case of a democratic leadership, and when this leadership puts forward revolutionary claims, the tension tends to be resolved at the expense of discipline.

Characteristically, the legitimacy of such a leadership rests on its claim to be able to abolish or at least substantially reduce the existing inequalities in society. From the argument that formal equality or equality before the law is but a limited good, it is often one short step to the argument that it is a hindrance or an obstacle to the establishment of real or substantive equality. The conflict between a 'progressive' executive and a 'conservative' judiciary is but one aspect of this larger problem. This conflict naturally acquires added piquancy when the executive is elected and the judiciary appointed.

A key argument the author is making is that:

A. in the context of extreme inequality, the issue of leadership had limited significance.
B. democracy is incapable of eradicating inequality.
C. formal equality facilitates development and change.
D. impersonal rules are good for avoiding instability but fall short of achieving real equality.

cat2001 verbal-ability passage-reading

## 5.16.69 Passage Reading: CAT 2001 | Question: 96 top

**The passage given below is followed by a question. Choose the best answer from the options given.**

The passage given below is followed by questions. Choose the best answer for each question.

Democracy rests on a tension between two different principles. There is, on the one hand, the principle of equality before the law, or, more generally, of equality, and, on the other, what may be described as the leadership principle. The first gives priority to rules and the second to persons. No matter how skilfully we contrive our schemes; there is a point beyond which the one principle cannot be promoted without some sacrifice of the other.

Alexis de Tocqueville, the great nineteenth century writer on democracy, maintained that the age of democracy, whose birth he was witnessing, would also be the age of mediocrity: in saying this he was thinking primarily of a regime of equality governed by impersonal rules. Despite his strong attachment to democracy, he took great pains to point out what he believed to be its negative side: a dead level plane of achievement in practically every sphere of life. The age of democracy would, in his view, be an unheroic age; there would not be room in it for either heroes or hero-worshippers.

But modern democracies have not been able to do without heroes: this too was foreseen, with much misgiving, by Tocqueville. Tocqueville viewed this with misgiving because he believed, rightly or wrongly, that unlike in aristocratic societies there was no proper place in a democracy for heroes and, hence, when they arose they would sooner or later turn into despots. Whether they require heroes or not, democracies certainly require leaders, and, in the contemporary age, breed them in great profusion; the problem is to know what to do with them.

In a world preoccupied with scientific rationality the advantages of a system based on an impersonal rule of law should be a recommendation with everybody. There is something orderly and predictable about such a system. When life is lived mainly in small, selfcontained communities, men are able to take finer personal distinctions into account in dealing with their fellow men. They are unable to do this in a large and amorphous society, and organised living would be impossible here without a system of impersonal rules. Above all, such a system guarantees a kind of equality to the extent that everybody, no matter in what station of life, is bound by the same explicit, often written, rules, and nobody is above them.

But a system governed solely by impersonal rules can at best ensure order and stability; it cannot create any shining vision of a future in which mere formal equality will be replaced by real equality and fellowship. A world governed by impersonal rules cannot easily change itself, or when it does, the change is so gradual as to make the basic and fundamental feature of society appear unchanged. For any kind of basic or fundamental change, a push is needed from within, a kind of individual initiative which will create new rules, new terms and conditions of life.

The issue of leadership thus acquires crucial significance in the context of change. If the modern age is preoccupied with scientific rationality, it is no less preoccupied with change. To accept what exists on its own terms is traditional, not modern,

and it may be all very well to appreciate tradition in music, dance and drama, but for society as a whole the choice has already been made in favour of modernisation and development. Moreover, in some countries the gap between ideal and reality has become so great that the argument for development and change is now irresistible.

In these countries no argument for development has greater appeal to urgency than the one which shows development to be the condition for the mitigation, if not the elimination, of inequality. There is something contradictory about the very presence of large inequalities in a society which professes to be democratic. It does not take people too long to realise that democracy by itself can guarantee only formal equality; beyond this, it can only whet people's appetite for real or substantive equality. From this arises their continued preoccupation with plans and schemes that will help to bridge the gap between the ideal of equality and the reality which is so contrary to it.

When pre-existing rules give no clear directions of change, leadership comes into its own. Every democracy invests its leadership with a measure of harisma, and expects from it a corresponding measure of energy and vitality. Now, the greater the urge for change in a society the stronger the appeal of a dynamic leadership in it. A dynamic leadership seeks to free itself from the constraints of existing rules; in a sense that is the test of dynamism. In this process it may take a turn at which it ceases to regard itself as being bound by these rules, placing itself above them. There is always a tension between 'charisma' and 'discipline' in the case of a democratic leadership, and when this leadership puts forward revolutionary claims, the tension tends to be resolved at the expense of discipline.

Characteristically, the legitimacy of such a leadership rests on its claim to be able to abolish or at least substantially reduce the existing inequalities in society. From the argument that formal equality or equality before the law is but a limited good, it is often one short step to the argument that it is a hindrance or an obstacle to the establishment of real or substantive equality. The conflict between a 'progressive' executive and a 'conservative' judiciary is but one aspect of this larger problem. This conflict naturally acquires added piquancy when the executive is elected and the judiciary appointed.

Which of the following four statements can be inferred from the above passage?

A. There is conflict between the pursuit of equality and individuality.

B. The disadvantages of impersonal rules can be overcome in small communities.

C. Despite limitations, impersonal rules are essential in large systems.

D. Inspired leadership, rather than plans and schemes, is more effective in bridging inequality.

A. B, D but not A, C

B. A, B but not C, D

C. A, D but not B, C

D. A, C but not B, D

cat2001 verbal-ability passage-reading

## 5.16.70 Passage Reading: CAT 2001 | Question: 97 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

In the modern scientific story, light was created not once but twice. The first time was in the Big Bang, when the universe began its existence as a glowing, expanding, fireball, which cooled off into darkness after a few million years. The second time was hundreds of millions of years later, when the cold material condensed into dense nuggets under the influence of gravity, and ignited to become the first stars.

Sir Martin Rees, Britain's astronomer royal, named the long interval between these two enlightenments the cosmic "Dark Age". The name describes not only the poorly lit conditions, but also the ignorance of astronomers about that period. Nobody knows exactly when the first stars formed, or how they organised themselves into galaxies-or even whether stars were the first luminous objects. They may have been preceded by quasars, which are mysterious, bright spots found at the centres of some galaxies.

Now, two independent groups of astronomers, one led by Robert Becker of the University of California, Davis, and the other by George Djorgovski of Caltech, claim to have peered far enough into space with their telescopes (and therefore backwards enough in time) to observe the closing days of the Dark Age.

The main problem that plagued previous efforts to study the Dark Age was not the lack of suitable telescopes, but rather the lack of suitable things at which to point them. Because these events took place over 13 billion years ago, if astronomers are to have any hope of unravelling them they must study objects that are at least 13 billion light years away. The best prospects are quasars, because they are so bright and compact that they can be seen across vast stretches of space. The energy source that powers a quasar is unknown, although it is suspected to be the intense gravity of a giant black hole. However, at the distances required for the study of Dark Age, even quasars are extremely rare and faint.

Recently some members of Dr. Becker's team announced their discovery of the four most distant quasars known. All the new quasars are terribly faint, a challenge that both teams overcome by peering at them through one of the twin Keck telescopes in Hawaii. These are the world's largest, and can therefore collect the most light. The new work by Dr. Becker's team analysed the light from all four quasars. Three of them appeared to be similar to ordinary, less distant quasars. However, the fourth and most distant, unlike any other quasar ever seen, showed unmistakable signs of being shrouded in a fog of hydrogen gas. This gas is leftover material from the Big Bang that did not condense into stars or quasars. It acts like fog because new-born stars and quasars emit mainly ultraviolet light, and hydrogen gas is opaque to ultraviolet. Seeing this fog had been the goal of

would-be Dark Age astronomers since 1965, when James Gunn and Bruce Peterson spelled out the technique for using quasars as backlighting beacons to observe the fog's ultraviolet shadow.

The fog prolonged the period of darkness until the heat from the first stars and quasars had the chance to ionise the hydrogen (breaking it into its constituent parts, protons and electrons). Ionised hydrogen is transparent to ultraviolet radiation, so at that moment the fog lifted and the universe became the well-lit place it is today. For this reason, the end of the Dark Age is called the "Epoch of Re-ionisation". Because the ultraviolet shadow is visible only in the most distant of four quasars, Dr. Becker's team concluded that the fog had dissipated completely by the time the universe was about 900 million years old, and one-seventh of its current size.

In the passage, the Dark Age refers to:

A. the period when the universe became cold after the Big Bang.
B. a period about which astronomers know very little.
C. the medieval period when cultural activity seemed to have come to an end.
D. the time that the universe took to heat up after the Big Bang.

cat2001 verbal-ability passage-reading

## 5.16.71 Passage Reading: CAT 2001 | Question: 98 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

In the modern scientific story, light was created not once but twice. The first time was in the Big Bang, when the universe began its existence as a glowing, expanding, fireball, which cooled off into darkness after a few million years. The second time was hundreds of millions of years later, when the cold material condensed into dense nuggets under the influence of gravity, and ignited to become the first stars.

Sir Martin Rees, Britain's astronomer royal, named the long interval between these two enlightenments the cosmic "Dark Age". The name describes not only the poorly lit conditions, but also the ignorance of astronomers about that period. Nobody knows exactly when the first stars formed, or how they organised themselves into galaxies-or even whether stars were the first luminous objects. They may have been preceded by quasars, which are mysterious, bright spots found at the centres of some galaxies.

Now, two independent groups of astronomers, one led by Robert Becker of the University of California, Davis, and the other by George Djorgovski of Caltech, claim to have peered far enough into space with their telescopes (and therefore backwards enough in time) to observe the closing days of the Dark Age.

The main problem that plagued previous efforts to study the Dark Age was not the lack of suitable telescopes, but rather the lack of suitable things at which to point them. Because these events took place over 13 billion years ago, if astronomers are to have any hope of unravelling them they must study objects that are at least 13 billion light years away. The best prospects are quasars, because they are so bright and compact that they can be seen across vast stretches of space. The energy source that powers a quasar is unknown, although it is suspected to be the intense gravity of a giant black hole. However, at the distances required for the study of Dark Age, even quasars are extremely rare and faint.

Recently some members of Dr. Becker's team announced their discovery of the four most distant quasars known. All the new quasars are terribly faint, a challenge that both teams overcome by peering at them through one of the twin Keck telescopes in Hawaii. These are the world's largest, and can therefore collect the most light. The new work by Dr. Becker's team analysed the light from all four quasars. Three of them appeared to be similar to ordinary, less distant quasars. However, the fourth and most distant, unlike any other quasar ever seen, showed unmistakable signs of being shrouded in a fog of hydrogen gas. This gas is leftover material from the Big Bang that did not condense into stars or quasars. It acts like fog because new-born stars and quasars emit mainly ultraviolet light, and hydrogen gas is opaque to ultraviolet. Seeing this fog had been the goal of would-be Dark Age astronomers since 1965, when James Gunn and Bruce Peterson spelled out the technique for using quasars as backlighting beacons to observe the fog's ultraviolet shadow.

The fog prolonged the period of darkness until the heat from the first stars and quasars had the chance to ionise the hydrogen (breaking it into its constituent parts, protons and electrons). Ionised hydrogen is transparent to ultraviolet radiation, so at that moment the fog lifted and the universe became the well-lit place it is today. For this reason, the end of the Dark Age is called the "Epoch of Re-ionisation". Because the ultraviolet shadow is visible only in the most distant of four quasars, Dr. Becker's team concluded that the fog had dissipated completely by the time the universe was about 900 million years old, and one-seventh of its current size.

Astronomers find it difficult to study the Dark Age because:

A. suitable telescopes are few.
B. the associated events took place aeons ago.
C. the energy source that powers a quasar is unknown.
D. their best chance is to study quasars, which are faint object to begin with.

cat2001 verbal-ability passage-reading

## 5.16.72 Passage Reading: CAT 2001 | Question: 99 top

**The passage given below is followed by a question. Choose the best answer from the given options.**

In the modern scientific story, light was created not once but twice. The first time was in the Big Bang, when the universe began its existence as a glowing, expanding, fireball, which cooled off into darkness after a few million years. The second time was hundreds of millions of years later, when the cold material condensed into dense nuggets under the influence of gravity, and ignited to become the first stars.

Sir Martin Rees, Britain's astronomer royal, named the long interval between these two enlightenments the cosmic "Dark Age". The name describes not only the poorly lit conditions, but also the ignorance of astronomers about that period. Nobody knows exactly when the first stars formed, or how they organised themselves into galaxies-or even whether stars were the first luminous objects. They may have been preceded by quasars, which are mysterious, bright spots found at the centres of some galaxies.

Now, two independent groups of astronomers, one led by Robert Becker of the University of California, Davis, and the other by George Djorgovski of Caltech, claim to have peered far enough into space with their telescopes (and therefore backwards enough in time) to observe the closing days of the Dark Age.

The main problem that plagued previous efforts to study the Dark Age was not the lack of suitable telescopes, but rather the lack of suitable things at which to point them. Because these events took place over 13 billion years ago, if astronomers are to have any hope of unravelling them they must study objects that are at least 13 billion light years away. The best prospects are quasars, because they are so bright and compact that they can be seen across vast stretches of space. The energy source that powers a quasar is unknown, although it is suspected to be the intense gravity of a giant black hole. However, at the distances required for the study of Dark Age, even quasars are extremely rare and faint.

Recently some members of Dr. Becker's team announced their discovery of the four most distant quasars known. All the new quasars are terribly faint, a challenge that both teams overcome by peering at them through one of the twin Keck telescopes in Hawaii. These are the world's largest, and can therefore collect the most light. The new work by Dr. Becker's team analysed the light from all four quasars. Three of them appeared to be similar to ordinary, less distant quasars. However, the fourth and most distant, unlike any other quasar ever seen, showed unmistakable signs of being shrouded in a fog of hydrogen gas. This gas is leftover material from the Big Bang that did not condense into stars or quasars. It acts like fog because new-born stars and quasars emit mainly ultraviolet light, and hydrogen gas is opaque to ultraviolet. Seeing this fog had been the goal of would-be Dark Age astronomers since 1965, when James Gunn and Bruce Peterson spelled out the technique for using quasars as backlighting beacons to observe the fog's ultraviolet shadow.

The fog prolonged the period of darkness until the heat from the first stars and quasars had the chance to ionise the hydrogen (breaking it into its constituent parts, protons and electrons). Ionised hydrogen is transparent to ultraviolet radiation, so at that moment the fog lifted and the universe became the well-lit place it is today. For this reason, the end of the Dark Age is called the "Epoch of Re-ionisation". Because the ultraviolet shadow is visible only in the most distant of four quasars, Dr. Becker's team concluded that the fog had dissipated completely by the time the universe was about 900 million years old, and one-seventh of its current size.

The four most distant quasars discovered recently

A. could only be seen with the help of large telescopes.
B. appear to be similar to other ordinary, quasars.
C. appear to be shrouded in a fog of hydrogen gas.
D. have been sought to be discovered by Dark Age astronomers since 1965.

cat2001 verbal-ability passage-reading

## 5.16.73 Passage Reading: CAT 2002 | Question: 1 top

**The passage given below is followed by a question. Choose the best answer.**

Cells are ultimate multitaskers: they can switch on genes and carry out their orders, talk to each other, divide into two, and much more, all at the same time. But they could not do any of these tricks without a power source to generate movement. The inside of a cell bustles with more traffic than Delhi roads, and, like all vehicles, the cell's moving parts need engines. Physicists and biologists have looked "under the hood" of the cell – and laid out the nuts and bolts on molecular engines.

The ability of such engines to convert chemical energy into motion is the envy of nanotechnology researchers looking for ways to power molecule-sized devices. Medical researchers also want to understand how these engines works. because these molecules are essential for cell division, scientists hope to shut down the rampant growth of cancer cells by deactivating certain motors. Improving motor-driven transport in nerve cells may also be helpful for treating diseases such as Alzheimer's, Parkinson's or ALS, also known as Lou Gehrig's disease.

We wouldn't make it far in life without motor: proteins. Our muscles wouldn't contract. We couldn't grow, because the growth process requires cells to duplicate their machinery and pull the copies apart. And our genes could be silent without the services

of messenger RNA, which carries genetic instructions over to the cell's protein-making factories. The movements that make these cellular activities possible occur along a complex network of threadlike fibers, or polymers, along which bundles of molecules travel like trams. The engines that power the cell's freight are three families of protein, called myosin, kinesin and dynein. For fuel, these proteins burn molecules of ATP, which cells make when they break down the carbohydrates and fats from the foods we eat. The energy from burning ATP causes changes in the proteins' shape that allow them to heave themselves on the polymer track. The results are impressive: In one second, the molecules can travel between 500 and 100 times their own diameter. If a car with a 5-foot-wide engine were efficient, it would travel 170 to 340 kmph.

Ronald Vale, a researcher at the Howard Hughes Medical Institute and the University of California at San Francisco, and Ronald Milligan of the Scripps Research Institute have realized a long-awaited goal by reconstructing the process by which mysom and kinesm move, almost down to the atom. The dynein motor, on the other hand, is still poorly understood. Myosin molecules, best known for their role in muscle contraction, from chains that lie between filaments of another protein called actin. Each myosin molecule has a tiny head that pokes out from the chain like oars from a canoe. Just as rowers propel their boat by stroking their oars through the water, the myosin molecules stick their heads into the actin and hoist themselves forward along the filament. While myosin moves along in short strokes, its cousin kinesin walks steadily along a different type of filament called a microtubule. Instead of using a projecting heads as a lever, kinesin walks on two "legs". Based on these differences, researchers used to think that myosin and kinesin were virtually unrelated. But newly discovered similarities in the motors' ATP-processing machinery now suggest that they share a common ancestor-molecule. At this point, scientists can only speculate as to what type of primitive cell-like structure this ancestor occupied as learned to burn ATP and use the energy t change share. "We will never really know, because we can't dig up the mains of ancient proteins, but that was probably a big evolutionary leap, " says Vale.

On a slightly larger scale, loner cells like sperm or infectious bacteria are prime movers that resolutely push their way through to other cells. As I., Mahadevan and Paul Matsudaira of the Massachusetts Institute of Technology explain, the engines in this case are springs or ratchets that are clusters of molecules, rather than single proteins like myosin and kinesin. Researchers don't yet fully understand these engines fueling process or the details of how they move, but the result is a force to be reckoned with. For example, one such engine is a springlike stalk connecting a single-celled organism called a vorticellid down at speeds approaching 3 inches (8 centimeters) per second.

Springs like this are coiled bundles of filaments that expand or contract in response to chemical cues. A wave of positivity charged calcium ions, for example, neutralizes the negative charges that keep the filaments extended. Some sperm use springlike engines made of actin filaments to shoot out a barb that penetrates the layers that surround an egg. And certain viruses use a similar apparatus to shoot their DNA into the host's cell. Ratchets are also useful for moving whole cells, including some other sperm and pathogens. These engines are filaments that simply grow at one end, attracting chemical building blocks from nearby. Because the other end is anchored in it place, the growing eng pushed against any barrier that gets in its way.

Both springs and ratchets are made up of small units that each move just slightly, but collectively produce a powerful movement. Ultimately, Mahadevan and Matsudaira hope to be better understand just how these particles create an effect that seems to be so much more than the sum of its parts. Might such an understanding provide an inspiration for ways to power artificial nano-sized devices in the future? "The short answer is absolutely," says Mahadevan. Hopefully, studying these structures will not only improve our understanding of the biological world, it will also enable us to copy them, take apart their components and re-create them for other purposes.

According to the author, research on the power source of the movement in cells can contribute to

A. control over the movement of genes with human systems
B. the understanding of nanotechnology
C. arresting the growth of cancer in a human being
D. the development of cures for a variety of diseases

cat2002 verbal-ability passage-reading

## 5.16.74 Passage Reading: CAT 2002 | Question: 10 top

**The passage given below is followed by a question. Choose the best answer.**

There are a seemingly endless variety of laws, restrictions, customs and traditions that affect the practice of abortion around the world. Globally, abortion is probably the single most controversial issue in the whole area of women's rights and family matters. It is an issue that inflames women's right groups, religious institutions, and the self-proclaimed "guardians" of public morality. The growing worldwide belief is that the right to control one's fertility is a basic human right. This has resulted in a worldwide trend towards liberalization of abortion laws. Forty percent of the world's population live in countries where induced abortion is permitted on request. An additional 25 percent live in countries where it is allowed if the women's life would be endangered if she were to go ahead with her pregnancy. The estimate is that between 26 and 31 million legal abortions were performed in 1987. However, there were also between 10 and 22 million illegal abortions performed in that year.

Feminists have viewed the patriarchal control of women's bodies as one of the prime issues facing the contemporary women's movement. They observe that the definition and control of women's reproductive freedom have always been the province of

men. Patriarchal religion, as manifest in Islamic fundamentalism, traditionalist Hindu practice, orthodox Judaism, and Roman Catholicism, has been an important historical contributory factor for this and continues to be an important presence in contemporary societies. In recent times, governments, usually controlled by men, have “given” women the right to contraceptive use and abortion access, when their countries were perceived to have an overpopulation problem. When these countries are perceived to be underpopulated, that right has been absent. Until the nineteenth century, a woman‟s rights to an abortion followed English common law; it could only be legally challenged if there was a "quickening", when the first movements of the foetus could be felt. In 1800, drugs to induce abortions were widely advertised in local newspapers. By 1900, abortion was banned in every state except to save the life of the mother. The change was strongly influenced by the medical profession, which focussed its campaign ostensibly on health and safety issues for pregnant women and the sanctity of life. Its position was also a means of control of non-licensed medical practitioners such as midwives and women healers who practiced abortion.

The anti-abortion campaign was also influenced by political considerations, The large influx of eastern and southern European immigrants with their large families was seen as a threat to the population balance of the future United States. Middle and Upper class Protestants were advocates of abortion as a form of birth control. By supporting abortion prohibitions the hope was that these Americans would have more children and thus prevent the tide of immigrant babies from overwhelming the demographic characteristics of Protestant America. The anti-abortion legislative position remained in effect in the Unites States through the first sixty-five years of the twentieth century. In the early 1960s, even when it was widely known that the drug thalidomide taken during pregnancy to alleviate anxiety was shown to contribute to the formation of deformed “flipper-like” hands or legs of children, abortion was illegal in the United States. A second health tragedy was the severe outbreak of rubet during the same time period, which also resulted in major birth defects. These tragedies combined with a change of attitude towards a woman’s right to privacy lead a number of states to pass abortion-permitting legislation.

On one side of the controversy are those who call themselves “pro-life”. They view the foetus as a human life rather than as an unformed complex of cells; therefore, they hold to the belief that abortion is essentially murder of an unborn child. These groups cite both legal and religious reasons for their opposition to abortion. Pro-life!! point to the rise in legalized abortion figures and see as morally intolerable. In the other side of the issue all those who call themselves “pro-choice”, they believe that women, not legislators or judges, should have the right to decide whether and under what circumstances they will bear children. Pro-choicers are of the opinion that law will not prevent women from having abortions and cite the horror stories of the past when many women dies in the hands of “backroom” abortionists and in desperate attempts to self-abort. They also observe that legalising abortion is especially important for rape victims and incest victims who became pregnant. They stress physical and mental health reasons why women should not have unwanted children.

To get better understanding of the current abortion controversy, let us examine a very important work by Krist Luker titled Abortion and the Politics of Motherhood. Luker argues that female pro-choice and pro-life activists hold different world views regarding gender, sex, and the meaning of parenthood. Moral positions on abortion are seen to be tied intimately to views on sexual behaviour, the care of children, family life, technology, and importance of the individual. Luker identifies “pro-choice” women, as educated, affluent and liberal. The contrasting counterparts, “pro-life” women, support traditional concepts of women as wives and mothers. It would be instructive to sketch out the differences in the world views of these two sets of women. Luker examines California, with its liberalized abortion law, as a case history. Public documents and newspaper accounts over a twenty-year period were analyzed over 200 interviews were held with both pro-life and pro-choice activists.

Luker found that pro-life and pro-choice activists have intrinsically different views with repect to gender, Pro-life women have a notion of public and private life. The proper place for men is in the public sphere of work; for women, it is the private sphere of the home. Men benefit through the nurturance of women; women benefit through the protection of men. Children are seen to be the ultimate beneficiaries of this arrangement by having the mother as a full-time loving parent and by having clear role models. “Prochoice” advocates reject the view of separate spheres. They object to the notion of the home being the “women’s sphere”. Women’s reproductive and family roles are seen as potential barriers to full equality. Motherhood is seen as a voluntary, not a mandatory of “natural” role.

In summarizing her findings, Liker believes that women become activists in either of the two movements as the end result of lives that center around different conceptualizations of motherhood. Their beliefs and values are rooted to the concrete circumstances of their lives, their educations and incomes, occupations, and the different marital and family choices that they have made. They represent two different world views of women’s roles in contemporary society and as such the abortion issues represents the battleground for the justification of the respective views.

Two health tragedies affecting U.S society in the 1960s led to

A. a change in attitude to women’s right to privacy
B. retaining the anti-abortion laws with some exceptions
C. scrapping of anti-abortion laws
D. strengthening of the pro-life lobby

## 5.16.75 Passage Reading: CAT 2002 | Question: 11 top

**The passage given below is followed by a question. Choose the best answer.**

There are a seemingly endless variety of laws, restrictions, customs and traditions that affect the practice of abortion around the world. Globally, abortion is probably the single most controversial issue in the whole area of women's rights and family matters. It is an issue that inflames women's right groups, religious institutions, and the self-proclaimed “guardians” of public morality. The growing worldwide belief is that the right to control one’s fertility is a basic human right. This has resulted in a worldwide trend towards liberalization of abortion laws. Forty percent of the world’s population live in countries where induced abortion is permitted on request. An additional 25 percent live in countries where it is allowed if the women's life would be endangered if she were to go ahead with her pregnancy. The estimate is that between 26 and 31 million legal abortions were performed in 1987. However, there were also between 10 and 22 million illegal abortions performed in that year.

Feminists have viewed the patriarchal control of women’s bodies as one of the prime issues facing the contemporary women's movement. They observe that the definition and control of women's reproductive freedom have always been the province of men. Patriarchal religion, as manifest in Islamic fundamentalism, traditionalist Hindu practice, orthodox Judaism, and Roman Catholicism, has been an important historical contributory factor for this and continues to be an important presence in contemporary societies. In recent times, governments, usually controlled by men, have “given” women the right to contraceptive use and abortion access, when their countries were perceived to have an overpopulation problem. When these countries are perceived to be underpopulated, that right has been absent. Until the nineteenth century, a woman‟s rights to an abortion followed English common law; it could only be legally challenged if there was a "quickening", when the first movements of the foetus could be felt. In 1800, drugs to induce abortions were widely advertised in local newspapers. By 1900, abortion was banned in every state except to save the life of the mother. The change was strongly influenced by the medical profession, which focussed its campaign ostensibly on health and safety issues for pregnant women and the sanctity of life. Its position was also a means of control of non-licensed medical practitioners such as midwives and women healers who practiced abortion.

The anti-abortion campaign was also influenced by political considerations, The large influx of eastern and southern European immigrants with their large families was seen as a threat to the population balance of the future United States. Middle and Upper class Protestants were advocates of abortion as a form of birth control. By supporting abortion prohibitions the hope was that these Americans would have more children and thus prevent the tide of immigrant babies from overwhelming the demographic characteristics of Protestant America. The anti-abortion legislative position remained in effect in the Unites States through the first sixty-five years of the twentieth century. In the early 1960s, even when it was widely known that the drug thalidomide taken during pregnancy to alleviate anxiety was shown to contribute to the formation of deformed “flipper-like” hands or legs of children, abortion was illegal in the United States. A second health tragedy was the severe outbreak of rubet during the same time period, which also resulted in major birth defects. These tragedies combined with a change of attitude towards a woman’s right to privacy lead a number of states to pass abortion-permitting legislation.

On one side of the controversy are those who call themselves “pro-life”. They view the foetus as a human life rather than as an unformed complex of cells; therefore, they hold to the belief that abortion is essentially murder of an unborn child. These groups cite both legal and religious reasons for their opposition to abortion. Pro-life!! point to the rise in legalized abortion figures and see as morally intolerable. In the other side of the issue all those who call themselves “pro-choice”, they believe that women, not legislators or judges, should have the right to decide whether and under what circumstances they will bear children. Pro-choicers are of the opinion that law will not prevent women from having abortions and cite the horror stories of the past when many women dies in the hands of “backroom” abortionists and in desperate attempts to self-abort. They also observe that legalising abortion is especially important for rape victims and incest victims who became pregnant. They stress physical and mental health reasons why women should not have unwanted children.

To get better understanding of the current abortion controversy, let us examine a very important work by Krist Luker titled Abortion and the Politics of Motherhood. Luker argues that female pro-choice and pro-life activists hold different world views regarding gender, sex, and the meaning of parenthood. Moral positions on abortion are seen to be tied intimately to views on sexual behaviour, the care of children, family life, technology, and importance of the individual. Luker identifies “pro-choice” women, as educated, affluent and liberal. The contrasting counterparts, “pro-life” women, support traditional concepts of women as wives and mothers. It would be instructive to sketch out the differences in the world views of these two sets of women. Luker examines California, with its liberalized abortion law, as a case history. Public documents and newspaper accounts over a twenty-year period were analyzed over 200 interviews were held with both pro-life and pro-choice activists.

Luker found that pro-life and pro-choice activists have intrinsically different views with repect to gender, Pro-life women have a notion of public and private life. The proper place for men is in the public sphere of work; for women, it is the private sphere of the home. Men benefit through the nurturance of women; women benefit through the protection of men. Children are seen to be the ultimate beneficiaries of this arrangement by having the mother as a full-time loving parent and by having clear role models. “Prochoice” advocates reject the view of separate spheres. They object to the notion of the home being the “women’s sphere”. Women’s reproductive and family roles are seen as potential barriers to full equality. Motherhood is seen as a voluntary, not a mandatory of “natural” role.

In summarizing her findings, Liker believes that women become activists in either of the two movements as the end result of lives that center around different conceptualizations of motherhood. Their beliefs and values are rooted to the concrete circumstances of their lives, their educations and incomes, occupations, and the different marital and family choices that they have made. They represent two different world views of women’s roles in contemporary society and as such the abortion issues represents the battleground for the justification of the respective views.

Historcally, the pro-choice movement has got support from, among others

A. major patriarchal religions
B. countries with low population density
C. medical profession
D. none of the above

## 5.16.76 Passage Reading: CAT 2002 | Question: 12 top

**Read the passage and answer the question:**

The production of histories of India has become very frequent in recent years and may well call for some explanation. Why so many and why this one in particular? The reason is a two fold one: changes in the Indian scene requiring a re-interpretation of the facts and changes in attitudes of historians about the essential elements of Indian history. These two considerations are in addition to the normal fact of fresh information, whether in the form of archeological discoveries throwing fresh light on an obscure period or culture, or the revelations caused by the opening of achieves ot the release of private papers. The changes in the Indian scene are too obvious to need emphasis. Only two generations ago British rule seemed to most India as well as British observers likely to extend into an indefinite future. Now there is a teenage generation which knows nothing of it. Changes in the attitudes of historians have occurs everywhere, changes in attitudes to the content of the subject as well as to particular countries, but in India there have been some special features. Prior to the British, Indian historiographers were mostly Muslims, who relied, as in the case of Sayyid Chulam Hussain, on their own recollection of events and on information from friends and men of affairs. Only a few like Abdul Fazl had access to official papers. These were mostly personal narratives of events, varying in value with the nature of the writer. The early British writers were officials. In the eighteenth they were concerned with some aspect of Company policy, or , like Robert Orme in his Military Transactions, gave a straight arrative in what we essentially a continuation of the Muslim tradition. In the early nineteenth century the writers were still, with two notable exceptions, officials, but they were now engaged in chronicling, in varying moods of zest, pride, and awe, the rise of the British power in India to supremacy. The two exceptions were James Mill, with his critical attitude to the Company and John Marchman, the Baptist missionary. But they like the officials, were anglo-centric in their attitude, so that the history of modern India in their hands came to be the history of the rise of the British in India.

The official school dominated the writing of Indian history until we get the first professional historian's approach Ramsay Muir and P.E Roberts in England and H.H Dodwell in India. Then Indian historians trained in the English school joined in, of whol the most distinguished was Sir Jadunath Sarkar and the other notable writers Surendranath Sen, Dr. Radhakumud Mukerji, and professor Nilakanda Sastri. They it may be said, restored India to Indian history, but their bias was mainly political. Finally, have come to nationalists who range from those who can find nothing good or true in the British to sophisticated historical philosophers like K.M Panikker.

Along with types of historians with their varying bias have gone changes in the attitude to the content of Indian history. Here Indian historian have been influenced both by their local situation and by changes of thought elsewhere. It is in this field that this work can claim some attention since it seeks to break new ground, or perhaps it deepens a freshly turned furrow in the field of Indian history. The early official historians were content with the glamour and drama of political history from Plassey to the Mutinity, from Duplex to the Sikhs. But when the Raj was settled down, glamour departed from politics, and they turned to the less glorious but more solid ground of administration. Not how India was conquered but how it was governed was the theme of this school historians. If found its archpriest in H.H Dodwell, its priestless in Dame Lillian Penson, and its chief shrine in the Volume V of the Cambridge history of India. Meanwhile in Britain other currents were moving, which led historical study into the economic and social fields. R.C. Dutt entered the first of these currents with his economic history of India to be followed more recently by the whole group of Indian economic historiansv. W.E. Moreland extended these studies to the Mughal Period. Social history is now being increasingly studied and there is also of course school of nationalist historians who see modern Indian history in terms of the rise and the fulfillment of the national movement.

All these approaches have value, but all share in the quality of being compartmental. It is enough to remove political history from its pedestal of being the only kind of history worth having if it is merely to put other types of history in its place. Too exclusive an attention to economic, social, or administrative history can be as sterile and misleading as too much concentration on politics. A whole subject into its elements and then fuse them together again into an integrated whole. The true history of a country must contain all the features just cited but must present them as parts of a single consistent theme.

Which of the following may be the closest in meaning to the statement "restored India to Indian history"?

A. Indian historian began writing Indian history
B. Trained historians began writing Indian history
C. Writing India-centric Indian history began
D. Indian history began to be written in India
